Annoyances of Spanish Travel-Valencia, Its Huerta, People, Curious Sights-Old Tarragona by Moonlight-Ancient Churches—Barcelona, etc.

Marseilles, Dec. 31, 1867.

A trip from Northern Spain may not inaptly be compared to entering a large animal trap. It is quite easy to get in but it is not so easy to get out unless the tourist is content to do nearly the whole thing over again. From Bayonne to the Mediterranean stops can be made at several stupid i ut interesting places, which break up the monotony of the trip; but there are no completed lines of railway along the sea, therefore the choice lies between poor coasting steamers or a return over the railway as far back as the junction at Alcazar, a station a few hours south from Madrid where another line branches off to Carthagena, Alcante, and Valencia

We left Malaga for Valencia at six in the morning, and returned to Cordova where we took another train northward to the Alcazar Junction which we reached at two hours past There are certain plants distributed all over the world midnight-nearly an hour behind time. Here we found the yielding a saponaceous juice which, to those who are desirous Valencia train in waiting, and as it was necessary to purchase of having a white, delicate skin, must be far preferable to tickets and get our luggage weighed and changed there was the finest "ambrosial," "milleflower," or "basket of fruit" no time to be lost, and what added to the peril of our situasoap. No doubt the ancients used such plants instead of tion the agent refused to take French gold, the first instance soap; perhaps they were the same still used for the like pur- of the kind we have met since we commenced our travels on pose in Italy and other neighboring countries. Pliny, in giv- the continent in June last. What were we to do in such a ing the description of one of them, says :-- "It grows on a dilemma? Parls instead of Madrid. Very fortunately for us a Frenchman standing near saw the fix we were in and true to his native instincts he relieved our situation by exchanging money which enabled us to pursue our journey as comfortably as we could on a cold, windy night in a slow Spanish train. But for this providential interposition there is no knowing exactly how we should have contrived to stop long at Alcazar or to have got away from that desolate place. The rural hotels in Spain are not intended to accommodate any body and nothing seems to surprise the proprietor more than to have a foreigner apply for lodging. The houses have no fireplaces, but warmth is supplied by the use of an old-fashioned brazier, which resembles a huge warming pan, into which burning charcoal and ashes are placed. Between the horrid diet and the tames of the brazier if the guest succeeds in escaping with his life he may consider himself a special favorite of a kind Providence.

The railways in Spain are usually very expensive works as owing to the mountainous character of the country there cars are divided into three classes, very similar, though generally much inferior to the French. The first-class cars are supplied with cylindrical-shaped vessels, covered with carpet and filled with hot water, which serve the most excellent purpose of keeping the feet warm. The cars are usually dirty, a national habit, scrupulously observed. The management of railways in Spain is more slipshod than in any other country, always excepting our own, with this great advantage in favor of Spain. All the highways and most frequented the passage of the trains, a precaution not so necessary here highways, so regardless of life, limb and property, and you astonish him greatly. One of them said to me "you permit leaned forward and kissed the pavement of the church. such things in your country and yet you boast of a civilization even in Africa. The instincts of self-preservation alone would require some necessary precaution."

Cuttle would say, the dictical cup from which but to look for lodgings, which we succeeded in finding in Being a mathematical instrument maker, and knowing the our Saviour drank wine at the Last Supper, and which can the top story of a hotel, where we found comfortable quarters great discomfort of carrying heavy instruments, I have often be seen for a fee on any afternoon about three o'clock if the and a very civil Italian landlord, who devoted himself to reflected upon reducing the weight of our usual instruments gentleman can be found who carries the key. He wears a making our stay agreeable. We thought at one time that without impairing their accuracy and strength, but have long black robe with girdle about the waist, low-quartered he intended to pay us something for stopping with him; but never fully satisfied myself how it could be accomplished, as shoes with silver buckles, head surmounted by a black felt our minds were disabused on that point the next morning. their construction is such that any further reduction of the hat, very broad brim, which rolls over at the sides like a We were glad, on the whole, of the break, as it enabled us to material would be detrimental to the accuracy.

he is ed

will not only fill the place of brass, but will in many respects be superior to it, and that all mathematical instruments should, if not wholly, be at least partially made of this metal, or of a compound containing it. Aluminum has already been used by Messrs. T. Cook & Sons, of York, England, for their astronomical instruments When I was there last year there were two large transit telescopes in process of constructhe telescopes (they being about seven feet long by an opening of the object glass of about six inches), there being no accuracy and an easy management. As at the present the cost of aluminum is too great for general use, until we discover a cheaper and more rapid process of extracting this metal, we must content ourselves by using a compound as above mentioned, which reduces the cost greatly and materially lessens the weight. The cost of working this metal will most probably be somewhat greater than that of brass, and as screws require great strength, in proportion to size, they

Aluminum has also proved of great advantage as a material for the smaller weights used in chemical analyses, on account of the greater difference in their sizes and consequent ease of handling.

If "Aluminist" desires to correspond on this subject of constructing instruments of this metal, I should be greatly pleased to answer any inquiry. L. BERGER.

Roxbury, Mass.

should be made of German silver.

[It seems as though the attention of our chemists and prac tical metal werkers might be profitably directed to the subject of a cheap and ready means of extracting aluminum. If procured cheaply it could be applied with great profit and advantage to various manufactures. The failures hitherto of compassing this object should not deter the enterprising and they are in use. persistent inventor.—EDS.

Bessemer Steel Rails--Homogeneousness of Metals.

Messes. Editors: - Your notice of the London Engineer's article on steel rails, or more particularly, the breaking of the steel rails at the Camden and Chalk Farm stations, may possibly, unless explained, have a tendency to mislead such persons as are not acquainted with the properties of the two metals for railroad and other purposes. I am glad to find adhere to "one." that you do not agree with the Engineer in its opinions of steel rails.

impossibility to make inferior pneumatic steel. It is true, it the question will be definitely solved by the showing of this is not so easy to make poor steel rails as it is to make poor diagram : iron rails, for we can box up in a pile an inferior material for rolling into iron rails. But with regard to steel rails there is no piling. The ingots are cast to suit the weight of rail or bar. It is true you can by the use of cast iron, contaminated with sulphur, phosphorus, and other destructive elements, produce an inferior quality of steel. You can also produce an inferior quality of steel by not thoroughly decarbonizing your iron, or by the use of an inferior carburizing material. But with the use of suitable materials, a skillful converter, and the Bessemer machinery, you can produce a homogeneous material with more economy and more certainty than by the old process. In fact I doubt very much if any of the commercial iron produced by the old process could be strictly called homogeneous, and you will, I think, admit that it is not so tough as pneumatic steel or iron, Chalk Farm rail notwithstanding.

Then if the iron is not homogeneous it must be heterogeneous, and a heterogeneous metal is a poor one for rails, for it is a law of physics that if two bodies impinging against each other are heterogeneous (or if one of them be so), the result will be electricity, and this electric current has a magnetic action in a direction cutting its own at right angles.

Then, Dufour says the tenacity of iron (homogeneous) is increased by the passage through it of an electric current. Thus, iron wire, 0 009248 m diameter, which sustained only Bunsen cell during 263 hours. This proves the assertion of Robert Mushet, Esq., that pneumatic steel, in all probability, will gain in toughness by exposure to the atmosphere and to Mr. Mushet is a better authority on this subject than he is.

As you say, it is well understood that cold hammering will produce crystallization; but it is not proved that the iron acted on was homogeneous-on the contrary it is more than probable that it was heterogeneous. We have proof that there is no alteration in the molecular structure of homogeneous steel by impact, unless it is that improves its toughness.

allowed for the exercise of the property of ductility, and the | wheel .- Eps. fracture will naturally be crystalline. But if time is given for the metal to exercise this property of ductility the fracture will be fibrous. I have seen the wool drawn over the eyes of inspectors of railroad bars in this way. Take, for in- AMERICAN, your correspondent under the head of "Relative and always used dry; It is much better than any thing else. bend one of them slowly round a sharp angle, and it will show

day of iron rails is passed; no railroad company that consults its own interest will lay any more iron rails on their lines.

What did the fracture of the broken steel rail that the Engineer writes so much about prove? Did it prove it to be uniform in quality, or in other words, did it prove it to be homogeneous? Not at all. Then why, in the name of com- always? The laws of nature are unyielding and inevitable, mon sense, condemn steel rails because of the maker's fault? We are aware that some of the makers of iron rails, and esof aluminum and copper, in order to reduce the weight of pecially those that do not feel like going to the expense of the larger the pump, the greater the quantity of water reputting up pneumatic steel works, will do all they can to impede the progress of the pneumatic process in this country, counterpoise, which is generally necessary in order to attain and probably join issue with such of the English railroad capitalists and free traders as have a large number of puddling furnaces and its machinery in the shape of invested and run the small one just twice the velocity of the large capital, that would of course depreciate in value should the one, it will require the same amount of water and deliver it process become more adopted. "Birds of a feather will flock together," as they say; but the day is passed to make a retrograde movement with regard to pneumatic steel in this by atmospheric pressure. The mechanism used in forming the country. It is all very well for those old fossils who would not read the handwriting on the wall a few years ago, and who have built works for the production of iron rails, to chuckle at this so-called failure of steel rails; but before it can be called a failure let us have some proof of it in such a way that it can be understood.

demands that tough, homogeneous steel rails, steel tires, axles, etc., be used in the construction of railroad plant. Alteration of molecular structure by impact is a bugbear-a humbug. Impact improves the tenacity of homogeneous steel rails. And with the aid of this last beautiful invention of Mr. Saxby's of testing iron by magnetism, an imperfect bar can be detected at the mill and of course rejected, so that there need be nothing used but perfectly homogeneous bars, which will increase in toughness the longer W. G. JR.

Pottsville, Pa.

Turning a Movable Wheel Around a Fixed Wheel.

MESSRS. H. M. T., Vol. XVI., page 347, inquires:-" How many revolutions, on its own axis, will a wheel make in rolling once around a fixed wheel of same size?" You answer

D. S H., Vol. XVII., page 39 says "two." You dissent, and

Now, premising the self-evident fact, that two diametrically opposite points on the periphery of a wheel cannot ex-It seems to me that engineers think that it is a matter of change places without a half revolution of the wheel, I think

A marks the position of the wheel before moving-the opposite points on its periphery being shown by the arrow, now pointing downward. Roll the wheel over one quadrant of the 2,545 kil., held 2,898 kil. after the action of a current of fixed wheel, and it takes the position, B, the arrow pointing upward. The opposite points have exchanged places, there fore the wheel has made a half revolution. Rolling over the second quadrant brings it to the position, C, the arrow pointthe impact of locomotive wheels, and that the notion of their ing downward. Here the points are again reversed, indicating becoming brittle from the latter cause is a mere phantom of another half-revolution, and the two halves constituting one the imagination, in confirmation of which not a single valid complete revolution in rolling over half of the circumference argument or proof can be adduced. This is true, and with of the fixed wheel. Rolling it over the remaining half will due respect to the editor of the Engineer, my opinion is that of course duplicate the above results. Therefore, the number of " revolutions, on its own axis, that a wheel will make in rolling once around a fixed wheel of same size," is two Don't you think so? L. M.

Germantown, Phila.

[No, we don't think so! We still adhere to "one," and our When iron is broken with great rapidity there is no time | wheel makes just one revolution in rolling around the fixed

Influence of Artificial Illumination on the Quality of the Air in Dwelling Houses.

MESSRS. EDITORS :- Carbonic acid gas is known to be very injurious to health, and it is, probably, the prevalent cause of bad air. This gas is constantly generated by the various contrivances for artificial light; but no experiments have until lately been made as to the value which this factor of the impurity of air may reach under different circumstances. Dumas states the important fact, that in gas illumination, both the consumption of oxygen and the production of carbonic acid is very considerable. In the Journal for Biology, of 1867, Dr. Zoch, a Hungarian chemist, communicates a series of determinations on the increase of carbonic acid in illuminating a room of a known capacity with gas, kerosene, and rape seed oil. Consumption of the lighting material, time, and intensity of light were self-evidently taken into account. In the following table the reader will find the increase of carbonic acid gas in the three modes of illumination calculated for the space of 100 cubic meters (131 cubic yards), and upon a lighting effect of 10 normal flames (1 normal candle = a stearin candle of 4 lb.), at the time of 1, 2, 3, and 4 hours.

Increase of C O., per thousand :

Burning Time.	Kerosene. 0,929	Street Gas. 0,708	Rape Seed Oil. 0,537
2h	1,456	1,342	1,038
3h	1,779	1,513	1,190
4h	1.811	1,562	1.229

From this table it may be seen that rape seed oil illumination generates the smallest amount of carbonic acid gas, and and kerosene most. As this mode of illumination is not very general, it is of no great practical importance that kerosene contributes most to vitiate the air, but it is a very different affair with gas illumination. Who has not noticed of late years in the illumination, of the stores, theaters, concert, and political halls of our great cities the fact that each attempts to rival his neighbor in the glaring effect of gas light, but at the same time who has not also made the observation that the greater the light the greater the oppressiveness and vitiation of the atmosphere. It is certain that this sentiment of discomfort is partly to be attributed to the radiant heat emitted by the flames, but the carbonic acid gas is nevertheless to be considered as its chief cause. The normal amount of this gas in the atmosphere is 0.50 to 0.65 per thousand, and an amount of from 2.75 is only to be met with in hospitals, prisons, and garrisons, where the process of respiration of many individuals is going on.

Artificial Writing Elates and Blackboards.

Messes, Editors :- On page 391, Vol. XVII., a correspondent asks the best recipe for painting blackboards or plastered walls; allow me to communicate the recipe I prescribed for painting more than 2,000 square feet of blackboard on the plastered walls of the class rooms in the Cooper Institute in this city, when it was organized in 1859; and also several hundred square feet in Girard College, Philadelphia, when I was connected there, as it gave perfect satisfaction and is still used in these institutions.

I first have the place of the wall intended to be covered. correspondent, by his diagram, proves himself wrong. P. H. VANDER WEYDE, M. D.

Saws and their Capabilities.

MESSES, EDITORS :- In the SCIENTIFIC AMERICAN of November 2d, 1867, Mr. Emerson, in answer to some remarks made by Mr Lamar Foss, concerning the power necessary to cut lumber, says that one horse power will cut 1,000 feet of lumber in ten hours running. It appears to me that Mr. Emersen takes exception to a general rule : claiming to do that amount of work with nice, clear, soft, and picked timber. Such is not generally the case; a mill must cut good, bad, and indifferent, hard and soft timber; and I would have supposed that Mr. Emerson would have aimed at giving us a unit power, if I may say so, for cutting 1,000 feet of lumber in a given time, answering the wants of the country at large, instead of making it a sectional affair. The first statement made about that big saw was such that it would induce the reader to believe that fifty horse power would drive it four hundred revolutions in a minute, with six inches feed, through a cut forty-one inches deep. Such a thing is impossible. At that rate, 50,000 feet of lumber in ten hours, with such a speed and feed, would be a very poor day's work. If 50,000 feet of lumber is considered a good day's work, such a big saw is not necessary. I am now running a fifty inch saw, and can cut 50,000 feet of Oregon fir (Douglas pine) in ten hours. One filing lasts us from four to six hours. My rule for applying power to circular saws is the following, the result of experience:

Taking seven-eighths of an inch for maximum feed for each single tooth, and two horse power being the power necessary to drive such tooth through a bolt six inches in thickness, at the rate of 500 revolutions a minute, it would follow that if I wanted to run a saw at such a speed and feed through eighteen inches, using sixteen teeth, or two inches feed, I would have 16×2×3=96 horse power, to be directly applied to the saw. If more or less feed is required, more or less power must be applied in proportion. From the foregoing rules, if the charge of applying power to that big saw was entrusted to me, and if it was really expected from me to run it with the feed and speed before mentioned, allowing only 36 inches cut, I would want $48\times2\times6=576\times4=460\frac{80}{100}$ horse power; and with suitable timber as regard to size and length, I would expect to cut over 200,000 feet of inch boards in ten hours, if the whole could be handled fast enough.

As a last remark, I would say that I believe, from my observations, that it requires fully three horse power to cut 1,000 feet of lumber in ten hours; two for the main saw, and one for the edger, that I have supposed to be at hand for the purpose. These conclusions come from trials made, where a dynamometer was used to ascertain the amount of the motive power, and the timber used was Oregon fir, which I suppose might be considered of average hardness as regards timber generally. It would be well for those engaged in manufacturing lumber to know rather than guess, and a few communications through your valuable paper, no matter how contradictory they might be, would not fail to throw more light on a subject that is yet not well understood. It would be well, if any communication is made, to have the motive power tested, and that on the saw mandrel. J. A. LESOURD.

Oak Point, Washington Territory.

Electrical Phenomenon.

office of the Atlantic and Pacific Telegraph Line. Wire No.1 wheels. of this line was down between this city and Syracuse. Suddenly it was discovered that neither wire would work. A continuous current of electricity was then observed to be passing over the wires through the several instruments, and this while the batteries were detached. The current seemed to be of the volume of a medium-sized pipe stem, and it gave the several colors of the rainbow, beautiful to behold. With the key open, the current flowed in waves or undulations, same phenomenon was observed at Buffalo and at Cleveland. wheel. The gas in the office here was lighted without difficulty by holding the end of a wire within an inch or two of the gas burner. The current was intense enough to shock one holding the wires or instruments-indeed, one of the employés of the office had his fingers scorched by the current. With closed keys the current was continuous, as before stated.

The theory advanced by an experienced electrician is this. The electrical equilibrium of the atmosphere had become disturbed by the sudden and extreme cold of the past two days-and we may say here that this phenomenon has never been witnessed except when cold weather prevails extensively-the electricity, instead of descending to the earth as in a thunder storm or in warm weather, ascends in the atmosphere, thus destroying the equilibrium and producing these magnificent displays. The broken wire spoken of, which rested on the ground, was the point of communication for the current from the earth. The electrician advances the iron from 31,000 to 41,000 pounds. theory that Aurora Borealis is produced from the same causes, and we submit that it is not an improbable theory. Every one has seen, undoubtedly, the wavy or undulating motions of the Aurora Borealis, and the wavy motions of the current last night with the batteries off and the key open were precisely the same.

Here we may notice one thing not generally known. A in this city, a few years since was telegraphed to New York to produce brittleness, and Toboo red shortness.

and from Boston to Portland by the electrical influences of the Aurora Borealis-all the batteries on the line being detached. This feat, it is said, has never been repeated.

APPARATUS FOR DETERMINING THE AMOUNT OF ALCOHOL IN FERMENTED LIQUORS.

this method cannot be employed, for the alcoholic strength bears no distinct relation to the specific gravity of the same. But as it is of great importance for wine and cider manufacturers, as well as for brewers and distillers, to be enabled to mentation, the exact amount of alcohol of the respective supplied to railroad companies. liquids, a practical method for obtaining this end must be considered as of great value, and such appears to be the form of car wheels made from anthracite iron, even if a proper

The distillate having collected therein precisely up to mark, , the alcohol lamp is to be extinguished, and cold distilled water or rain water added thereto, up to mark, b. In order not to transgress said mark, the pipette, Fig. 2, is used, by which the water can be added by drops. If then the indications of the hydrometer (Fig. 3) and the thermometer are marked down, the tube accompanying the apparatus will show the precise alcoholic strength of the substance distilled. The table is simple and easily understood. We are informed that Henry Guth, optician, 104 Delancey street, New York, furnishes these apparatus.

Car Wheels---Their Composition and Causes of Breakage.

With the frequent accidents caused by the breaking of car wheels, we know, says the American Railroad Journal, of no The Rochester Union says that one of the most beautiful subject connected with railways demanding greater attenelectrical phenomena imaginable was lately witnessed in the tion on the part of engineers than the use of the strongest

In most treatises on iron, the texture of cast iron is said to be granular, it is in fact crystallized as found by chemical experiment and microscopic investigation. Crystals of gray iron being octahedral, their maximum limit when cubic, being 1 5000 of an inch in linear dimension, and about 200000000 of a grain in weight; crystals in white or chilled iron are smaller, and most frequently occur in six sided prisms, sometimes connected in fascicles by their ends, at other by their and from the surcharged wire it would leap over the insulated sides, in a sort of stellated or radiated arrangement, as may portions of the key and flow along the wires beyond. The be readily observed in a fragment from the tread of a chilled

The density of cast iron is from 7.1 to 7.5 of a porous nature, under hydraulic pressure water having been forced through four inches of metal. By remelting in an air furnace, its strength has been increased up to twelve meltings, though the same result has not been found with the cupola.

The purer the iron is from foreign particles the greater cohesion its crystals have with each other, which constitutes the difference between strong and weak irons. So great is its affinity for other substances, that its ores are seldom found pure, and as the foreign matters form the quality of the metal smelted from the ores, it is evident that each peculiarity of the ore is imparted to the iron made from it.

The best qualities of charcoal pig iron give, by analysis : Iron, 96,992 per cent; carbon, 2,800; silicon, 0,208, with traces of manganese and copper. The tensile strength of the pig, from 18,000 to 28,000 pounds per square inch. Remelted

old, carbon 85 parts, water 12 parts, ashes 3 parts. The best qualities of ores and the fuel show an entire freedom from either sulphur or phosphorus.

Phosphorus imparts the quality of shortness at low temperatures, and there are but few irons in which a trace of this substance cannot be found. One per cent of phosphorus rendering iron to be of a very bad quality and of limited use.

In the manufacture of car wheels, the pig metal is melted with anthracite coal in the cupola. Anthracite coal contains For the quantitative determination of alcohol in simple carbon 88.50 parts, volatile matter 7.50 parts, ashes 4.00. Avalcoholic mixtures the specific gravity plan is generally erage specimens of white ash anthracite coal from Pennsylmade use of. This method being based upon the difference vania contains in 100 parts sulphur 0.91 per cent. All variewhich exists between the specific weights of the liquids, ties of hard coal contain sulphur in a more or less degree, recommends itself for correctness and simplicity, and is there- combined with iron in the form of iron pyrites, disseminated fore most applicable for practical use. For liquids, however, through the coal. Anthracite iron, or iron smelted with anin which the alcohol is associated with several substances, thracite coal, from its want of strength owing to the sulphur and other impurities in it, is never used for car wheels.

Having noted the peculiarities of the best charcoal irons, and charcoal, as compared with anthracite iron and anthracite coal, it becomes a matter of much importance to inquire determine at any time, during and after the process of fer- how far these elements effect the car wheels as generally

But few, if any, railroads would be willing to risk the use

chill could be put on them to insure wear. The general practice is to remelt the old car wheels with anthracite coal, using from one third to two thirds of new metal. With each remelting the affinity of the iron for foreign substances absorbs the sulphur from the coal, resulting, with each remelting of the old wheels, in a weaker iron, and thus the process goes on from year to year.

How near the mixture thus made, claimed to be pure charcoal iron, is the genuine article, can readily be conjectured; but with this process comes poor wheels, breakage, and loss of life.

Cast iron, when in constant vibration, as in a car wheel in use under express cars, soon wears out, or "become tired," the granular formation is

mileage than wheels under cars or engines with frequent

Another great cause of breakage is due to the extreme water receptacle, D, is a coil of cooling pipe, connected with pressure used in pushing the wheels upon the axle; a presthe glass reservoir and terminating just above the cylinder, E. sure of 10 to 12 tuns per wheel holding it fast, as well as 30 To ascertain the proportion of alcohol in any liquor, the or 40 tuns as is frequently used, which strains the wheel,

beneath. Cooler, D, having been filled with cold water, the sive car wheel works was established at Ramapo, N. Y., on vapors conducted through pipe, F, are condensed, and drop the Erie railway, for the purpose of making wheels entirely of pure metal from the Richmond and Salisbury mines.

The Richmond iron, famous for ordnance—the United States Government having used not less than twelve thousand tuns for guns-and recently so successfully tried in the Rodman Gun trial at Shoeburyness, England, having a tensile strength of from 31,000 to 41,000 pounds per square inch, has proved itself to be one of the strongest of cast irons for guns.

To ascertain its relative strength in car wheels, experiments were made by the Pennsylvania Railroad Company, July 17th, 1867, in comparison with the wheels in use on this road as follows:

No. Maker.		Size.	Weight.	on each wheel.			No. of blows.
1	Omitted	in. 33	496	49	24	13	86
2	**	32	631	21	21	45	87
3	"	33	546	9	7	23	39
4	Ramapo	33	519	59	152	80	291
5	Omitted	33	549	36	28	_	64
6	44	32	513	51	43	-	94
7	"	33	510	20	9	12	41

* Each wheel was tested in three places, if not destroyed by previous blows. By the first set of blows given, all of the wheels, with the exception of the Ramapo wheel, were entirely destroyed, the subsequent blows being given to test various portions of the remaining plates.

The Ramapo wheel, with each trial, was only dented or crushed in, and after many repeated blows on the rim, a portion was broken out to show the texture of the iron.

As to the wearing qualities of the Ramapo wheel, the Erie Railway Company report them equal to any in use. On the Morris and Essex railroad out of 700 wheels in constant use over nine months, with a constant load of 10 tuns per car, running 400 miles a week, but one wheel has failed, and that caused by accident. Similar results are reported from other roads using them. The cost is somewhat higher than the ordinary class of wheels, but the wear and great security amply repay it.

Action of Ozone on Sensitive Photographic Plates.

Dr. Emerson Reynolds stated before the Dublin Chemical and Philosophical Club that he had been performing some experiments upon the above subject, and that he had found that when the latent image (i. e., the image before it was developed) was submitted to the action of ozone it was completely obliterated-not only was it impossible to develop the image, but a second image might be retaken in the camera upon the same plate. The author remarked that this was against the theory which might be called the mechanical theory of photographic images, and proved conclusively that it was due to chemical change in the sensitive film. He also thought that Charcoal, the fuel with which the ores are smelted, when many of the disputes in connection with the length of time new and pure, consist of carbon 97 parts, ashes 3 parts. When dry plates might remain sensitive, was probably owing more or less to the quantity of ozone present in the air.

The ozone used in these experiments was in some cases procured by passing atmospheric air over phosphorus, and in The effect of sulphur on iron is to cause brittleness at all others by the silent discharge, viz., by attaching one of the temperatures, red shortness when hot, to such a degree that platinum wires of the reservoir to the prime conductor of a portion of the Irrepressible Conflict speech of Wm. H. Seward experiment has shown that even 3000 of sulphur is enough machine, and turning it slowly, the other wire being in communication with the ground,

HOUSEHOLD HINTS.

REMOVING CORKS FROM BOTTLES .- Sometimes a cork i pushed down into the bottle or vial which it is desirable to remove. A very effectual way to do it is to insert a strong twine in a loop and engage the cork in any direction most convenient. It can then be withdrawn by a "strong pull the cork generally yielding sufficiently to pass through the neck.

LOOSENING GROUND GLASS STOPPLES .- Sometimes the ground glass stopples of bottles become, from one cause or another, fixed in the neck and cannot be removed by pulling or torsion. An effectual method is to wrap a rag wet with hot water around the neck and let it remain a few seconds. The heat will expand the neck of the bottle, when the stopple can be removed before the heat penetrates the stopple itself. Or, wind a string once or twice around the neck, and, holding the bottle between the knees, pull alternately on one and the other end, thus creating friction and consequently heat. Or a little camphene oil dropped between the neck and stopple of the bottle will often relieve the stopple.

SHARPENING LEAD PENCILS.—A narrow blade—a pen blade -should be used for this purpose, as the back of a wide blade is almost certain to break the lead point just before the point is finished. A little thought will readily show the reason of this.

REMOVING A TIGHT FINGER RING.—It is seldom necessary to file off a ring which is too tight to readily pass the joint of the finger. If the finger is swollen apply cold water to reduce the inflammation, then wrap a small rag wet in hot water around the ring to expand the metal, and soap the finger. A needle threaded with strong silk can then be passed between the ring and finger, and a person holding the two ends and pulling the silk while slowly sliding it around the periphery of the ring may readily remove the ring. If the ring is a plain hoop this process is easy; if it has a setting or protuberance more care will be required. Another method is to pass a piece of sewing silk under the ring and wind the thread, in pretty close spirals and snugly, around the finger to the end. Then take the lower end-that below the ringand begin unwinding. The ring is certain to be removed unless the silk is very weak. The winding compresses the finger and renders the operation less difficult.

CRACKING GLASS BY SUDDEN HEATING.—Probably more articles of glass in daily use are broken by being suddenly heated than by blows or other acts of carelessness. Glass is a very poor conductor of heat, and when hot water is poured suddenly into a tumbler or goblet, it is almost certain to break unless the glass itself is quite warm. Tepid water should be first used, or a little cold water be poured into the glass on which the hot water may be drawn. Lamp chimneys frequently crack when placed upon the lighted lamp, especially if taken from a cold room. The proper remedy is to turn up the flame slowly or by degrees.

INJURY TO MARBLE AND VARNISHED ARTICLES .- Marble being a carbonate of lime and the two substances not having a very great affinity, care should be taken in the use of marble furniture and ornaments, as tables, mantels, statuary, etc. Acids of any kind will more or less affect marble, and they should not be allowed to touch it. The slabs on which acids are allowed to stand soon lose their polish and are liable to a degree of disintegration which impairs their beauty Fruits, sauces, vinegar, etc., should not be allowed to come in contact with a marble-topped table or shelf. All varnishes used on woods are to a certain extent soluble in alcohol; therefore all liquids containing alcohol, as wines or spirit, should be kept from varnished furniture.

OIL STAINS IN MARBLE,-Stains in marble caused by oil can be removed by applying common clay saturated with benzine. If the grease has remained long enough it will have become acidulated and may injure the polish, but the stain will be removed.

Number of Useful Plants.

A German author states that the number of useful plants has risen to about 12,000, but that others will no doubt be discovered, as the researches yet made have been completed in only portions of the earth. Of these plants there are 1,350 varieties of edible fruits, berries, and seeds; 108 cereals, 37 onions; 460 vegetables and salads; 40 species of palms; 32 varieties of arrowroot, and 31 different kinds of sugars. Various drinks are obtained from 200 plants, and aromatics from 266. There are 50 substitutes for coffee, and 129 for tea. Tannin is present in 140 plants, caoutchouc in 96, guttapercha in 7, rosin and balsamic gums in 387, wax in 10, and grease and essential oils in 330; 88 plants contain potash, soda, and iodine; 650 contain dyes, 47 soap, 260 weaving fibers; 44 fibers used in paper making; 48 give roofing materials, and 100 are employed for hurdles and copses. In building 740 plants are used, and there are 615 known poisonous plants. One of the most gratifying developments is, that out of 278 known natural families of plants, there are but 18 species for which no use has yet been discovered.

Cask-Boring Beetles.

Beer drinkers in India complain that the quality of the pale ale now sent out to them is inferior to that supplied a in all directions, this mischievous little borer makes its way into the staves until they become a mere honeycomb, held toto pieces and examined, it was calculated that there were 134,000 perforations communicating with the outer surface, and long processions of beetles were found in the holes. No

seems to know when the pest first appeared in India, but it when new. The lines, A A, show the shape of the teeth when had been complained of in Burmah before 1855. Since then filed to the last row of holes. These perforations tend greatly all, and was last heard of at Secunderabad. Some people by friction they become warm. think the germ of the insect is in the wood before it leaves casks from attack.—Athenaum.

Improvement in Circular Saws.

The engravings present views of an improvement in saws which was patented through the Scientific American Patent | the plowing up of the upper stone of a Roman mill-induced

EMERSON'S PATENT PERFORATED SAW PLATES.

Agency in this country and Europe by J. E. Emerson, July | fore, come upon the antiquarians in the neighborhood most un-16, 1867. Its advantages will be apparent to practical saw- expectedly. Discovery of Roman Remains.

About the commencement of November a mere accident-

examination of a field situated on the glebe farm in the township of Amotherby and parish of Appleton-le-Street, with surprising results. The Rev. James Robertson, of Appleton, is the explorer, and this gentleman has up to the present time laid bare a series of large paved floors, varying from 6 inches to 2 feet 6 inches below the surface of the land. Beyond the fact that an occasional piece of Roman pottery was picked up in the soil, there was no indication of any remains in the field, and the present discoveries have, there-

pavements. These are irregular in outline and varying in size, one being 150 feet across. Some are detached, while others have paved pathways as connections. The floors are paved with blocks of oolite limestone and sandstone (the latter mostly burnt quite dark in color) and sea pebbles, in some parts flat slabs of limestone being paved edgewise. The floors are not level, but fall off to the sides. Under the crown there is generally a deposit of ashes, charcoal, and burnt animal bones. Below this is a second pavement. All round the edges the burnt matter extends-a sort of breccia, which yields quantities of broken Roman pottery of various kindswheel-made and otherwise. Some bits of Samian ware have been found. The hand-made pottery is very rude. Singularly. nearly the whole of it-nine pieces in every ten, certainlyconsists of the rims of various vessels. A few necks and handles of amphorae have turned out. The major part of the pottery is found round the edges of the floors, and somewhat below their level. The teeth present are those of the ox, deer. hog, dog, and bones of birds. Nearly a complete skull of the wild boar was found. Two upper stones of mills (querns) have been found, several fragments of the nether millstones. but not a perfect one. Between the paving stones much Roman pottery has turned out. Of implements, none have been found of metal, but a remarkably fine red flint "scraper," a flint "drill," and some other flints have been picked up, with a "spindle whorl" of Samian pottery and another similarly formed (unpierced) of stone. Some scraps of iron-one half of a very small horseshoe, not grooved-have also been found. One illegible silver coin, and two small brass Roman coins of Constantine have been picked up. Several peculiarly rubbed sea pebbles and other stones, some grooved, have been found. The full examination of the field will occupy a length of time. The floors found are left bare for inspection. The excavations were suddenly stopped on Saturday by heavy rains, and the places cut out in the clay, in which the floors are, are now full of water, on which there is a thick cover of retained for a long time, and it is thought no further digging can now take place till next summer .- London Times.

The American Mountain Railway.

Essentially the system of Dr. Fontaine's mountain railway was illustrated and described on page 197, Vol. XVI. We are now in receipt of a large diagram and descriptive pamphlet showing the embodiment of some improvements on the original plan. As now constructed an ordinary balloon is to furnish the ascensive and motive power; a platform midway between the passenger car and balloon is provided with wheels which run on an elevated inclined railroad provided with sets of double rails. The ascensive tendency of the balloon, being in part restrained by the rails, is resolved into two forces, one of which is perpendicular to the inclined plane, the other acting parallel to that plane; the former causes the wheels to adhere to the upper rails, the latter drawing the elevator upward obliquely. When the summit is reached, few years ago; and the importers are crying out loudly about the plates are cleaned off with sawdust, which is wiped from water is pumped into a compartment of the car and the extra the ravages of a beetle which eats holes in the casks and sets | the surface with a piece of leather. The mixed oil, and saw- | weight causes the balloon to gradually descend. The action them leaking. Through and through, and up and down, and dust lodges in the holes and when the plate is subjected to of the wind upon the balloon is counterbalanced by the weight the drawing or tempering process this takes fire and by its of the cars which by their traction act as counterpoises, and conjointly with the buoyancy of the balloons, prevent the gether by the hoops. In one of the casks, which was taken tain their proper temper. The number and position of the bending of the elevators on their axes. The advantages claimed by the inventor over the Fell or other mountain railways, are safety, a high rate of speed, cheapness of construction, and the superiority of an elevated over surface roads

USE OF SCREW PLATES --- TEMPERING SAWS FOR MACHINISTS' USE.

scales, which from their hard, gritty nature, grind away the from the iron or steel, either by the turning tool, file, or or the dies. It is not an uncommon practice with some cleaner appearance; but this is a very bad custom, especially when the forging requires to be screwed. It very often hapdies belonging to the screwing machine, or with the screw turning the work (on account of using a very hard tool), the steel the dies or screw plate is made of will be thought bad, annealed rather than hardened. In all cases when an impure iron is made use of for forgings, and which will subsequently require to be screwed, either with the screw dies or the screw plate, or which may require to be cut with circular cutters or with circular saws, the forgings should always be annealed previous to leaving the smithy. The forgings, of course, will be the better for being annealed, supposing they are to be screwed with the screw tools belonging to the turning lathe; though it is not of so much importance as when they are to be screwed with the dies, or the screw plate, or cut with circular cutters, or circular saws, because the again, provided they chip from being very hard; whereas, the generality of screw dies, screw-plates, and circular cutters, and even circular saws, when very hard, and once spoilt, will not admit of being again sharpened, but will be practically useless, until they have been annealed, and cut up again, and subsequently hardened. Annealing makes the iron more uniform in temper, and will save much subsequent trouble it will greatly facilitate the work when fiting it up.

cular saws at once (for cutting metals), they may be enclosed in a sheet-iron case, or box; they will require to be surrounded on all sides with either wood or animal charcoal. Sufficient space, of course, must be left every way for the expanof course must not be urged.) As soon as the whole arrive towards the mouth of the fire, the lid taken off and the saws the saw as it passes through it. The burnt oil forms a rect action of the water, and lessens the risk of fracture.

Though saws are the better for being inclosed in a box and surrounded with charcoal when heating them, still, when a single saw is required to be hardened in a hurry, it will be more expeditious to place it upon a piece of cold sheet-iron, and then to heat the iron and the saw in the midst of the ignited fuel of a hollow fire; and when it arrives at the proper it has a tendency to prevent the saw buckling in heating. separately between two flat lumps of tallow). Tallow differs from oil in the absorption of heat for its fusion; consequently, a more considerable degree of hardness is given to the may be made sufficiently hard for some purposes by heating the blades to a red heat and then placing them between two heavy surface plates; the surface plates will be better if they be smeared with tallow, previous to putting the blade between them. When the saws are removed from the hardening trough, they are generally brittle and warped ; consequently, they will require to be tempered and hammered flat. The tempering may be performed in a variety of ways, depending of course upon the size, shape, and quantity. Circular saws in diameter in them, will require to be tempered to a light straw color. These may be tempered by first brightening their surfaces, and then placing them upon a piece of hot iron. The piece of iron which will be required for tempering these kinds of saws may be made by the following method. Take a piece of round bar iron, one inch in diameter and eight or nine inches in length; heat one end of it and hammer it so as to make it fit into the small square hole in the anvil; at

from the extreme end, weld a moderate sized iron collar; the collar should be made of half round iron, so that it will, after it is welded upon the piece of round bar, form a large Screw plates and screw dies are often ruined by being used lump, the shape of a round ball. The object of this large upon iron and steel rough from the forge, and covered with lump is to retain the heat for a considerable time, so that several of the saws may be tempered before the iron will require threads. In all cases the rough scale should be removed to be reheated. If two of these lumps were made, one of them could be in the fire becoming heated, whilst the other grinding stone, previous to screwing it with the screw plate lump is being used; so that, if it were necessary, a continuance of the process may be kept up. The object of having workmen, after they have finished forging a piece of iron this lump the shape of a round ball, is that it may not supwork, and while the iron is at a red heat, to immerse it in ply the heat too suddenly to the saw. If this lump was made water and partly cool it, with a view of giving the work a flat, it would supply the heat too suddenly, unless it was used at a very low temperature; it is evident it would not then temper more than one or two of the saws before it pens that the iron contains veins of steel, which harden by would require to be reheated. The object of having this immersion; and, though the metal may not be so hard as round lump welded upon a piece of round bar, is for the conto prevent its being cut with a hard turning tool, still, when venience of keeping the lump in position upon the anvil, and it comes to be screwed with the stocks and dies, or with the to prevent the operator from always being in a stooping position when tempering the saws. The iron being finished, plates (which tools are always less hard than the turning it is now ready to be heated for tempering the saws. The tools), it will speil the dies or the screw plates; and because large lump will require to be heated to a red heat, after this hard place or places do not happen to be detected when which the opposite end of the iron must be placed in the hole in the anvil. The saws may now be placed (one at a time) upon the lump; a slow rotary motion must be given to the or badly tempered. The fact is, the work should always be saw, by the use of a small stick of wood, in order to equalize the heat. The end of the round bar at the top of the lump will help to supply heat and keep the saw in position whilst it is being turned round upon the lump. As soon as a light straw color appears upon the saw, it must be taken off the iron and cooled, either in water or oil; or, if the heat has not been too suddenly applied, the saw may be allowed to cool in the air of its own accord. These kinds of small circular saws are generally, after hardening, convex on one side and concave on the other. This imperfection is owing to the outer part of the saw becoming too small to contain the central part. When the practice of securing the saws upon the spinscrew tools belonging to the turning-lathe can be ground dle by circular plates screwed firmly against each side is adopted, a small degree of regular convexity is not very detrimental, because the plates bring the saw straight; but, when they are convex in a greater degree they will require to be slightly hammered. The outer part of the saw is the part which requires to be hammered, in order to expand the outer part and bring the middle flat.

These kinds of saws may be tempered, and the trouble of brightening their surfaces spared, by smearing them with oil When it is required to harden a large quantity of stout cir. or tallow and holding them one at a time over a slow clear an in ting apparatus, consisting of reservoirs of ink of divers colors, if refire until the oil or tallow begins to smoke, after which the saw must be immersed in oil and partly cooled; it must then be held over the fire a second time, until the oil again begins to smoke. If the saw is immersed in the oil and held over sion of the saws ; otherwise they will become buckled in heat- the fire a third time, it will ensure a more regular degree of bottle. ing. After the saws are inclosed and the box luted with clay temper. Care must be taken each time the saw is heated not or loam, the whole may be placed in a suitable furnace or to raise the temperature beyond that which is necessary to hollow fire and the saws heated to a cherry-red heat (the fire cause the oil to smoke; otherwise the saw will become too soft for the purpose it is intended for-namely, cutting hard at the proper uniform temperature, the box must be drawn substances. By this method the saws acquire the same temper as that which they acquire when tempered to a straw taken out separately. They may either be taken out of the color. A large quantity of these kinds of saws may be tembox with the pliers or by a small rod of iron, having a small | pered more expeditiously by threading them upon a piece of hook turned upon one end of it. The saws will require to be | iron wire, and then placing them in a proper vessel with as immersed edgeways in a trough containing water, the sur- much oil or tallow as will cover them (the wire is for conface of which must be covered with a film of oil. The oil venience in lifting the saws out of the vessel), and then to will float of itself upon the surface of the water and burn upon | place the whole over a small clear fire, or over a gas flame, until the oil or tallow begins to smoke, after which the saws coating of coal upon the saw, which protects it from the di- must be taken out. They may then be cooled in water or oil or they may be allowed to become cool in the air. This indi cates the same temper as that called a straw color.—Ede.

Preserving Fresh Flowers.

Flowers may be kept in pretty fair condition, say for a week or ten days, according to the species selected for bouquets and the time of the year, by renewing the water every alternate | ion, mounted on the wrist pin, additional revolutions or parts of revolutions temperature, it must be taken off the plate and immersed in day, and while doing so rejecting decayed flowers and leaves, the hardening fluid. By placing the saw upon a piece of cold and taking care to cut off from the stems immersed in water, sheet-iron, it causes the heat to be very slowly applied, and with a sharp pair of scissors, about from a quarter to half inch of the length; then should be added to the water about Oil alone, or oil in which tallow has been dissolved, is suffi- a pinch of salt, and a few grains of saltpetre for every pint cient to give the thinnest kinds of saws a sufficient degree of fluid; when flowers are very much faded they may be re of hardness; but those of a medium thickness are the better | vived by immersion of the stems for two or three minutes in for being hardened in solid tallow (the saws may be placed hot water, or better yet in strong spirits of wine, or Eau de Cologne; in some cases liquid ammonia may be advantageously applied to the stems for a few minutes to revive flowers These recommendations are applied by several of the largest steel by the tallow than by the oil; besides, it hardens the horticulturists of Ghent and other parts of Belgium, and steel to a greater depth than oil. Very thin blades of steel found to answer in practice very well if properly applied. To keep well, flowers should not, after being cut, be placed in localities where there is tobacco-smoke, or bad ventilation neither should the rooms be too much heated.

MANUFACTURING, MINING, AND RAILROAD ITEMS.

There are ten marble quarries now in successful operation in West Rutland, Vt., and three others in process of development. The entire thickness coarsest of colored rocks, the best often lying in close proximity to the stems in a perfectly inbricated state.

One of the last and most important events of the year 1967, was the complewas the last link of this line constructed.

A gentleman of San Francisco has made arrangements with European capitalists to introduce the cultivation, on a large scale, of the sugar beet, and to establish factories for the production of raw sugar therefrom, in California. The capitalists have agreed to invest \$1,500,000 in the enterprise, and to im-

will yield two per cent more sugar than those of France, and as the industry is now so profitable in the latter country, the prospect is encouraging for its growth in the Golden State.

Prof. Whitney reports that of the sixty-four elementary substances existing in nature, so far as known to chemists, there are but thirty-six which have yet been proven to occur in California in mineral combination, and twenty-three elements are wanting on the Pacific coast. Of these, a few are extremely rare, such as didymtum, erbium, lanthanum, thorlum, but the absence of others is surprising. Finorine, a substance of very general distribution, in its most abundant source, fluor spar, seems entirely wanting in California , although it may yet be discovered in the micas. Taking the whole Pacific coast, from British Columbia to Chill, the following facts appear. The paucity of species, considering the extent of region as compared with other parts of the world; the remarkable absence of prominent silicates, especially of the zeolites; the wide spread of the practous metals; the abundance of copper ores, and comparative absence of tin and lead; the similarity in the mineralized condition of the silver; the absence as vein stone of fluor; no mineral species peculiar to the coast,

In the United States, at the beginning of the year 1863 there are now, 38,821.81 miles of railway built and actually operated. The aggregate cost of construction has been \$1,699,460,809. Pennsylvania has the greatest number of miles in operation, viz., 4,252.10; Ohio ranks next, with 3,397.81 miles; then Illinois, 3,224.49 miles. Oregon has 19.50 miles. The cost of construction for each mile has been greater in New Jersey than in any other of the States, and in California next, being for the former, \$70,857; for the latter, \$70,824.

The Tucker Manufacturing Company, in Boston, is the originator of a process for bronzing castings, which possess the color and the true aspect of east bronze, without being galvanized, or covered with an alloy, as ordinarily done. The process consists in coating the articles to be colored with a very thin layer of some vegetable oil, and exposing them to a temperate heat. The oil, on being decomposed, combines with the film of oxide formed on the sur face of the metal, thus yielding that peculiar color of bronzed iron. The temperature to which the castings are brought is not so high as to carbonize the fatty matter; it only reaches that point at which the metal for itself is getting blue. The brown layer thus obtained is said to be as durable and protective as that resulting by the method hitherto practised; at least, the process met with great appreciation in Parls.

American and Koreign Latents.

Under this heading we shall publish weekly notes of some of the more prominent home and foreign patents.

POCKET GRAIN TESTER.-B. Martin, Prairie du Chien, Wis,-The object of this invention is to obtain a neat and light instrument by which the relative weight of grain, as compared with its bulk, may be readily ascertained, and which can be made so small as to be conveniently carried in the pocket.

HAND ROLL AND TWISTING MACHINE.-R. Moxley, Muscatine, Iowa.-This invention consists in a new and more simple and compact arrangement of the parts of a hand roll and twisting machine, by which labor is saved, and the machine more easily operated than heretofore.

PRINTING MACHINE.-James McDermott, Frederick, Md.-This is a hand printing apparatus. The type is held in a curved bad, or turtle, and the inking roller has a corresponding shape. The type are made of India rubber, and are retained in their places by the flanges of the adjustable spacing bars, which rest upon the base piece of each letter. At the end of the bed piece is quired, with mouths from which it exudes on to the roller.

CORE EXTRACTOR, - James Morton, Philadelobia, Pa.-This invention relates to a new device for extracting the cork-screw, with the cork, from the neck of a bottle, and consists of three bars, of which one has a socket or cap fitted to its lower end, to be placed upon and around the upper end of the

FOUNTAIN INESTAND .- N. Gray Bartlett, Keokuk, Iowa .- This improvement is intended to remedy a deject in ordinary fountain inkstands, and consists in the employment of an overflow chamber, so disposed in the inkstand that its bottom or floor stands slightly above the floor of the duct leading from the reservoir to the pen orifice or tountain tube.

BOXED HONE .- Joseph Potter and Olif Abell, Whitehall, N. Y .- This invention consists in encasing the hone, or whetstone, or other grinding material, in a wooden or other box, in such a manner that its grinding surface projects above the box, and so that it cannot fall out or be easily removed from the box, and in providing a cover for the said box, whereby the grinding surface of the hone may be protected from injury.

CHANGE GATE. - John B. Slawson, New York city. - This invention relates to a gate to be arranged in the doors or walls of railroad cars, stages, and other public vehicles, said gate being so arranged that it can be opened on either side, and that it will at once close itself when released, the gate being connected with a bell, which will be struck whenever the gate is opened.

CULTIVATOR .- A. Bennett, Rockford, Ill .- This invention relates to an im provement in corn cultivators, and consists in the combination and arrangement of a sulky frame mounted on two wheels, and double plow beams attrehed thereto, for the shovels to work on both sides of a row of corn, in such a manner as to be entirely under the control of the driver in his seat.

MECHANICAL MOVEMENT.-Ephralm Soper, New York city.-This invention relates to a new manner of arranging the cranks of machinery, and consists in fitting gear wheels to the crank, so as to obtain from a stationary pla-

DEVICE FOR RAISING CASES, BARRELS, ETC.-Robert Smith, Brooklyn, N. Y .- This invention relates to a device by which casks, barrels, and other similar articles can be easily transported up or down stairs or steps, and also on level ground, and consists chiefly in the use of a frame, which is provided with a series of wheels on its under side. These wheels are arranged in rows in such a manner that when the frame is drawn up steps one wheel will al ways be on the edge of a step, and the device can thus be drawn up stairs with case.

COFFEE MILL.-W. J. Lane, Washington, N. Y.-This invention relates to a new and useful improvement in that class of coffee mills which are fitted in the upper part of a box provided with a drawer and arrange i like an ordinary hand mill for grinding spice. The invention consists in the application of a flange to the lever part of the mill for the purpose of giving a downward direction to the ground coffee and preventing it from flying about or being scattered in its discharge from the mill, a contingency attended with considerable annoyance as the ground coffee finds its way between the sides of the drawer and box and every time the drawer is withdrawn from the box the latter requires to be cleaned thoroughly in order to avoid waste and to admit of the ready insertion of the drawer.

STAMP MILL FOR CRUSHING QUARTZ .- George B. Mitchell, Nevada, Colorado.-The chief difficulty attending the operation of stamp mills for crushing quartz consists in the wearing of the stems and the lower boxes of the same, a result due to the adhesion of pulverized rock or quartz to the stems and the introduction of the pulverized rock or quartz into the boxes of the stone in these quarries is nearly fifty feet, and it is so stratified that it by the elevation or upward movement of the stems. This invention fully can be easily worked in separate layers, ranging from two to six feet in obviates this difficulty and it consists in intro incing into the lower boxes of which are required for sawing hard substances (such as iron thickness. Successive strates frequently present a great variety, both in color the stems water from a supply pipe and in such a manner as to keep the or steel), and which have a round spindle hole, about one inch and quality, from purest white, the marble so valued by sculptors, to the stems perfectly clear or free from the pulyerized quartz and also keep the

> REAPING AND MOWING MACHINE, -D. S. Fisher, Codar Spring, Ind.-This invention relates to a new and improved reaping and mowing machine of tion of unbroken communication between this city and the Rocky Mountains. | that class in which the sickle or sickles are driven by a cam and lever in A temporary railway bridge thrown across the Missouri railway at Omaha. Hou of the ordinary crank and connecting rod. The invention consists in a peculiar construction of the sickle, driving apparatus, grain-discharging device and adjustable wheels on the main frame, whereby a very superior reaper and mower of the class specified is obtained.

EYE GLASSES AND SPECTACLES .- J. J. Bansch, Rochester, N. Y .- This inthe opposite end of this piece of iron and at about two inches | portaix or seven hundred skilled laborers. The California beets, it is said, such a manner that the two parts which contain the lenses may be adjusted when the eye glasses or spectacles are adjusted on the nose, will have a proper relative position with the eyes.

COMBINED GRAIN DRILL, ROLLER AND PLANTER.-T. S. Mills, Kendleville, Ind,-This invention relates to a new and improved combined grain drill, relier and planter, and consists in a novel construction and arrange ment of the parts, whereby several advantages are obtained over other sim-Har combined implements now in use.

BERRY Box .- Truman Mabbett, Jr., Vineland, N. J .- This invention is designed to supersede the small baskets and boxes now used for conveying berries and small fruit to market. The invention consists in a novel construction of the box, whereby the berries are effectually prevented from being bruised or injured in their transit from place to place, a free circulation of air allowed therein when a series of boxes are packed within a case and the boxes rendered capable of being manufactured at a very moderate cost.

MACHINE FOR POINTING PICKETS .- W. W. Johnson, Nashville, Tenn .-The object of this invention is to point the ends of pickets or fence palings and cut circular sides or edges on other wood work.

Horse Collar. - Thomas Moore, New York city. - This invention relates to an improvement in the construction of horse coliars.

ANIMAL TRAP.-James P. Wigal, Henderson, Ky,-This invention has for its object to furnish an improved self setting animal trap which shall be simple in construction, convenient, and effective to operation and not liable to get out of order.

ATTACHMENT FOR HARNESSES .- W. W. Beebe, Dubuque, lowa .- This in vention relates to an attachment for either single or double barnesses, the object of which is to overcome and cure in a horse all inclination to be balky when driven, whether such horse is in single or double harness.

IRON FOR HARNESS PADS .- Heber R. Ridgley, Mansfield, Ohlo, - This in vention relates to an improved method of forming the frame iron of harness pads, and the attaching of the pad thereto.

GATE .- Ralf Adams, Ottawa, Ill .- This invention is a gate which can be opened from a vehicle or the saddle. It has a rack operated by levers, the rack engaging with a pinion on the bottom of the post of the gate, with other devices perfecting the whole mechanism.

MOVABLE BARREL STAND .- P. J. Skinner, Oswego, N. Y .- This invention, as its name imports, is a movable barrel stand for use in groceries or liquor stores where many barrels are employed and set in rows.

WORM FENCES AND PENS .- John Will, Bryan, Ohio .- This invention relates to an improvement in worm fences, and consists in a fence divided into panels or sections, composed of ratis or boards boited together by upright cleats and having notches at either end, the notches at one end being on the under part of each board and fitting into notches between two cleats on the upper part of the boards of the adjoining panel.

CHURN.-A. J. Heavner, Time, Ill.-This invention relates to an improvement in churns, and consists in a dasher constructed in two parts, one part working within the other, the two dashers being operated by two cranks working simultaneously.

SAFETY PLUG FOR BOILERS .- T. G. Eiswald, Providence, R.I.-This invention consists of small fusible plugs placed at the low water level of boilers and provided against being prematurely blown out by being located in contcal seats. When the water level passes below the plugs they are melted out. and thus announce the state of the water.

CARPET STRETCHER .- Alexander L. Dunbar, Sheldon, Ill .- This invention relates to a novel and useful implement or device for stretching carpets when to be laid or put down by tacking or otherwise, upon floors, which implement is so constructed that it can be applied to the carpet, and suitably operated to stretch it and there hold it.

COMBINED CATHETER AND SYRINGE .- Dr. N. B. Sornborger, Northampton Mass .- The combined catheter and syringe embraced in this invention is provided with a collar on its body or cylinder, susceptible of adjustment at will, and thus through a stem or rod connecting it with a collar arranged to slide upon the discharge tube or passage of the syringe.

BAGGAGE CHECK .- Edward Flather, Bridgeport, Conn.-This invention relates to an improved baggage check, and consists of a slotted arm or bar revolving on a screw set in a circular disk on which the names of various places or numbers are marked. The name of the place desired to be indicated is seen through the slot in the arm which is secured in place by a pin attached to the arm and fitting into a hole in the disk. Or the required number may be indicated by the pin being set into the hole opposite thereto.

IMPROVEMENT IN GATES -Lewis Essig, Clinton, Ohio .- This invention relates to a new and improved method of banging and operating the gates of farms, plantations, &c., whereby the same are easily opened by a rider, withont alighting for that purpose.

IMPROVED ATE CONDENSER .- H. J. Bailey, Pittsburgh, Pa .- This invention relates to a new and improved apparatus for condensing air for various purposes, but more particularly for forcing liquids; and the invention consists in an arrangement of vessels, which communicate with each other by pipes or tubes-such communication being controlled by valves or cocks, which are operated by floats and governed by hydraulic pressure, whereby the apparatus is made automatic or self acting.

IMPROVED ANNEALING FURNACE.-W. R. Thomas, Catasauqua, Pa.-This invention consists in the construction of a furnace for annealing car wheels whereby the hubs of the said wheels may be raised to a high temperature without injury to the hardened or chilled run or tread of the wheel; and also in placing rings of metal between the wheels, as they are placed in the furnace for the piotection of the rims.

IMPROVEMENT IN WATER WHEELS .- William Snodgrass, Cold Spring, Wis .- This invention is to so construct a water wheel that the full or nearly the full per centage of power may be obtained, which is due from water under a given head; and the invention consists in providing for a free escape of air from the buckets or floats, and in bringing the full pressure of the water to act upon a given point of the wheel, in a manner similar to the ac tion of water on the piston of a water engine.

IMPROVED ARGAND GAS BURNER.-George Mooney, Providence, R. I .-This improvement relates to the manner in which the burner is formed, and to the method of regulating the flow of the gas; and the invention consists firstly, in forming the burner of one piece of metal; secondly, in forming the gas jet spertures without drilling, and thirdly, checking and regulating the flow of gas by a screw.

IMPROVEMENT IN CRUTCHES .- James C. Bhodes, Stillwater, Minn .- This invention relates to a new and improved device for preventing the end of a crutch from slipping on ice or other slipping places; and it consists in arranging an adjustable spur or point in the end of the crutch.

IMPROVEMENT IN CULTIVATORS .- James B. Sexton, Pella, Iowa .- This invention has for its object to furnish a simple, cheap, convenient and durable cultivator.

INSTRUMENT FOR DRAWING AN ELIPSE.-Franklin Bowly, Winchester, Va .- This invention relates to an improved instrument for describing elipses of various diameters, and consists in a marking rod, on which is a graduated scale for fixing the major and minor diameters of the elipse to be described, which marking rod is connected with two sliding rods that govern its cliptical motion around a common center pin.

BLOCKS OR SUPPORTS FOR THE KEEL AND BILGE TO VESSELS IN DOCES .-Joseph T. Parlour, Brooklyn, N. Y .- This invention more particularly relates to a block for supporting a vessel by its keel or bilge when laid up in a dock for repairs, which block is made in parts or section; for adjustment, either in a higher or lower plane, as may be desired.

MANUFACTURE OF PENS .- Edwin Wiley, Brooklyn, N. Y .- The present invention relates to that class of pens commonly known as the " Union Pens," and which are made with their nib of gold, and their heel or body of silver or other inferior metal.

CORN HUSKING MACHINE.-H. W. Knowlton, Saratoga Springs, N. Y .-This invention relates to a new and improved machine for stripping Indian corn from the stalks, and taking the husks from the cars. The invention consists of a pair of stripping rollers, one of which is armed with stripping ,

in such relation to each other and to the eyes of the wearer that the lenses | blades, in connection with a series of husking aprons arranged to work over rollers, whereby the ears of corn may be broken or detached from the stalks and the husks removed from the detached cars with the greatest facility.

STREAM OR RIVER FENCE .- H. A. Kephart, Fletcher, O .- This invention relates to a new fence to be placed across rivers and streams. The invention consists in a novel construction and arrangement of parts whereby due provision to made against the passage of cattle or animals around the ends of the fence when the stream or river is low, and provision also made for the passage of drift wood over the fence without the liability of the same being injured thereby. The invention also consists in a novel construction and application of the fence at the central or deep part of the river or stream whereby said portion of the fence may be readily put up or adjusted, and not be liable to be injured by drift wood or floods.

Answers to Correspondents.

CORRESPONDENTS who expect to receive answers to their letters must, in all cases, sign their names. We have a right to know those who seek in formation from us; besides, as sometimes happens, we may prefer to address the correspondent by mail.

SPECIAL NOTE.-This column is designed for the general interest and in struction of our readers, not for gratuitous replies to questions of a purely business or personal nature. We will publish such inquiries, however, when paid for as advertisemets at \$1.00 a line, under the head of "Business and Personal."

IN All references to back numbers should be by volume and page.

J. G., of Canada.-The oil used by woolen manufacturers is either that known as gallipoli, an inferior sort of olive oil, or palm cil, neither of which are very expensive.

J. A. G., of Pa .- We do not know of any chemical which could be mixed with light varnish to make paper water proof. The ordinary varnish to coat maps, however, which you probably require is prepared by pulverizing 1 oz. sandarac, 1/2 oz. mastic, 1/2 oz. elenir. dissolving them in % oz. of venet, turpentine, and adding to it a solution of i oz. shellac and 3 oz. oil of lavender in 12 oz. alcohol.

J. B., of Ky .- In reply to your inquiry as to the manufacture of crucibles, you will find in one of the first numbers of this journal of 1867, in an article, " Plumbago and its use," some remarks on the manufacture of plumbago melting pots which perhaps may be useful to you.

G. A. H., of N. Y .- The difficulty you encounter in forming an alloy of platinum and copper may have its reason in different causes, of which we are not aware, not having witnessed your operations. Platinum we suppose you know, can only be melted before the oxy-hydrogen fire. You will find much information about the melting of platinum in referring to the articles of M. Deville, in the back numbers of the "Annales de chimiest physique.

J. W., of Mass.-Phenylic alcohol (carbolic acid) in the proportion of about one per cent after having been previously dissolved in water will undoubtedly be an excellent means of preventing mold in flour paste.

C. H. G., of Tenn .- " What cheap material can be mixed with plaster of Paris that will leave it as bard or harder no matter what color it will produce?" Most anything will depreciate the quality of plaster of Paris, which should consist of nothing but sulphate of lime. We remember that at the late fair of the American Institute in New York a premium was refused to an exhibitor of that product because the judge of the group happened to find some carbonates in it.

E. W., of Mass.-Oil when put on boots will scarcely have any protective influence against cold. . . . In painting the outer coating of a Leyden vial you will insulate it. Electricity in the Leyden jar resides on the glass as is shown by the experiment with the three separable pieces (vide Sillimann's "Principles of Physics," chapter, Accumulated Electricity), but we close the mouth of the jar, as the air Itself is a con ductor of electricity, particularly when moist. For the stuffing of the rattle snake you speak of we recommend to you crude naphtalin; it is preferable to arsenic soap.

A. P., of Ky.-For the detection of sulphur or better, sulphur compounds in water, heat it in a test tube while holding a strip of paper im pregnated with sugar of lead over the orifice. It sulphur is present the paper will be covered with a brownish film. Lime will show itself by adding exalate of ammonta to the liquid. The iron in the water you speak of must be present as a protoxide and then a blue color will be produced by adding red prusslate of potassa. The sulphur may either be present as H S or Ca S.

B. C., of N. H., asks if the subjection to smoke, as in the baconing process, would have a preservative effect on stakes to be driven into the ground and what substances in burning produce a smoke of the strongest creosoting effect? Mere exposure to smoke will never do for the preservation of stakes, especially if employed for agricultural purposes. For such and other purposes we recommend as the cheapest and best material the so-called pitch or dead oil. Heat the oil in an iron pot and fill a tight barrel to the hight of about two feet and leave the stakes in it for two and a half or three hours. The pitch or dead oil is obtained in the distillation of benzole and other light bydrocarbons and can now-a-days be purchased in every large city.

G. F. W., of Mass .- Provence oil is the oleum olivarum otim the olive before perfect maturity.

J. L. D., of Mass., asks how to put quicksilver on the back of Monday, the 16th day of March next. a looking glass. The coating of a mirror is made by spreading tin foll smoothly on a stone table, rubbing a little mercury (containing tin) over it to amalgamate the surface, pouring a large quantity of mercury on it, pushing the clean glass plate on this, beginning along one edge, pressing it with weights and giving the table top gradually an inclined position to drain off the excess of mercury.

V. D. W., of N. Y., adds to the information given on page 391, Vol. XVII., to " C. S., of Minn.," who asks how to the a word copper kettle., the following : A thick coating may be obtained by preparing a tinning solution of zine dissolved in hydro-chloric or muriatic acid, making the solution as thick or heavily charged with zinc as possible, adding a little salamoniac. Clean the inside of the kettle, place it in a charcoal fire until a piece of block tin placed inside melts, then rub the melted tin, with some of the tinning solution quickly on the copper surface by means of a ball of oakum and a little powdered redn; the tin will readily adhere. Wrought iron and steel may be tinued in the same manner. We know of no effectual method of tinning east iron.

E. A. L., of Mo., asks if there are any clocks made which are specially designed for use on locomotive engines and calculated to keep time notwithstanding the jars of the machine. We thinks such clocks are quite common. They are what are called "spring clocks." We lately saw a steam fire engine with one attached, and a fire steamer is subject to as many and as severe jolts as a locomotive.

S. A., of Iowa, says he has cleaned his steam boilers with soda and asks if its use is detrimental to the iron. We reply, it is not.

R. S. B., of N. Y., referring to the communication of "C. B., cannot be introduced in sleigh bells, and recommends the manufacture and | Stimpson as executor aforesaid, the 17th day of October, 1851, a than discord. We have seen several sleigh teams so ornamented, but the "strings." They were not arranged to hand.

W. W. T., of Mass., asks what sort of a filter he shall use for purifying the water flowing from a spring into his trout hatching boxes. We recommend passing the water through a filter of charcoal and gravel. A little manual entitled "The House," published by G. E. & F. W. Woodward, 37 Park Row, New York city, has an engraving and description of such a filter as W. W. T. needs.

H. H. C., of N. Y., inquires for a method of determining the required amount of lap on a slide valve to cut off at any given point, the stroke of the valve not being known! We cannot furnish the information

W. P. G., of N. H.—Potassium and sodium melt below 212 degrees, the temperature of boiling water. Silver requires 1,873 degrees Fah., for tusion while cast iron requires 2,786 degrees.

T L. S., of Me.-The enamel of iron hollow ware is made of powdered flints, ground with calcined borax, fine clay, and a little feldspar. This mixture is made into a paste with water and brushed over the pots after they have been scoured with diluted sulphuric acid and rinsed clean with water. While still moist they are dusted over with a glaze composed of feldspar, carbonate of sodium, borax, and a little oxide of tin. Thus prepared, the pots are gradually dried and then the glaze's fired or foxed under a muffle at a bright red heat. Oxide of lead, although increasing the fusibility of the glaze, impairs its efficiency as it will not resist the action of acids in cooking.

P. J., of Pa.-It is a mistake to suppose that water will not affect the composition of glass. At a high temperatuae water acts upon glass very rapidly. Turner suspended plate and window glass in the steam of a high-pressure poller, and in four months the specimens, one-fourth of an inch thick, were completely decomposed. Faraday found that fint glass under similar circumstances was still more rapidly acted upon.

B. A. B., of N. J.—The kaolin or porcelain clay used in the manufacture of fine" China" ware is furnished by the decomposition of a granttic rock, the constituents of which are quartz, feldspar, and mica.

Business and Lersonal.

The charge for inscrition under this head is one dollar a line.

For Gas-Pipe Screwing and Cutting-off Machines for Hand or Power, or any tool used by Steam and Gas Fitters, address Camden Tool and Tube Works Co., Camden, N.J.

A Large Marble Factory to rent on the Hudson River. Address Davis' Machinery Yard, 124 Hudson st., Jersey City.

Parties in want of Fine Tools or Machinists' Supplies send for price list to Goodnow & Wightman, 23 Cornbill, Boston, Mass.

Patent Office Reports.—Persons desiring Patent Office Reports can be supplied at low prices. Address Samuel C. Jones, Box 773, New York City P. O.

Wanted-Parties to build the Geiser thresher and separator at Racine, Wis., ground for shops will be donated. Address W. W. Dingee, Racine, Wis.

Parties having shoe lace tagging machinery for sale, new or second-hand, address postpaid, box 106, Toronto, Ontario.

Parties having patterns for cast brass ferrules for chisel handles will receive orders by sending address to S. F. Gold, Cornwall, Conn.

Manufacturers of shingle machines please send circulars and price list to A. J. Shotwell, Montgomery Station, Daviess Co., Ind.

Wanted-A small plainer (bed 5 or 6 feet), new or secondhand, if in good order. Address J. & B. S. Ayars, Greenwich, N. J., with price and description.

Allen's Catalogue of Agricultural and Household Implements and Machinery, Seeds and Fertilizers .- Messrs, R. H. Allen & Co., 189 and 191 Water street, New York, who conduct the largest business in Agricultural and Horticultural Implements, of all American houses engaged in general dealings of the kind, have just issued a new edition of their very complete and handsome Catalogue for the current and coming season. It fills 225 pages, illustrated with nearly 400 engravings, and is sent to applicants for \$1-less than the actual cost of production, and this amount is deducted on the receipt of orders from those who have paid it.

EXTENSION NOTICES.

Morris Mattson, of New York city, having petitioned for the extension of patent granted to him the 4th day of April, 1854, for an improvement in enema syringes, for seven years from the expiration of said patent, which takes place on the 4th day of April, 1868, it is ordered that the said petition be heard at the Patent Office on Monday, the 16th day of March next.

Carmi Hart, of Bridgeport, Conu., having petitioned for the extension of a patent granted to him the 4th day of April, 1851, for an improvement in machine for cutting veneers, for seven years from the expiraton of said patent, which takes place on the 4ta day of April, 1868, it is ordered that the said petition be heard at the Patent Office on Monday, the 18th day of March next.

James McCirty, of Reading, Pa., having petitioned for the extension of a patent granted to him the 4th day of April, 1854, for an improvement in heating skelps for the manufacture of wrought iron tubes, for seven years of the Pharmacopolia and is obtained from the pericarp or fleshy part of from the expiration of said patent, which takes place on the 4th day of April, 1968, it is ordered that the said petition be heard at the Patent Office on

> L. Otto P. Meyer, of Newtown, Conn., having petitioned for the extension of a patent granted to him the 4th day of April, 1854, for an improvement in treating caoutchoue and other vulcanizable gums, for seven years from the expiration of said patent, which takes place on the 4th day of April, 1868, it is ordered that the said petition be heard at the Patent Office on Monday, the 16th day of March next.

> Samuel J. Parker, of Ithaca, N. Y., having petitioned for the extension of a patent granted to him the 11th day of April, 1854, for an improvement in sewing machines, for seven years from the expiration of said patent, which takes place on the 11th day of April, 1888, it is ordered that the said petition be heard at the Patent Office on Monday, the 23d day of March next.

> James L. Catheart, of Georgetown, D. C., having petitioned for the extenion of a patent granted to him the 18th day of April, 1854, for an improvenent in attaching propellers to the driving shaft, for seven years from the expiration of said patent, which takes place on the 18th day of April, 1868, it a ordered that the said petition be heard at the Patent Office on Monday, the 0th day of March next.

> James Buell, executor of the estate of James McGregor, Jr., deceased, of New York city, having petitioned for the extension of a patent granted to the said James McGregor, Jr., the 11th day of April, 1854, for an improvement in the construction of tea and coffee pots, for seven years from the expiration of said patent, which takes place on the 11th day of April, 1868, it is ordered that the said petition be heard at the Patent Office on Monday, the 23d day of March next.

Julia M. Colburn, administratrix, da donis non, of James H. Stimpson, deceased, who was executor of James Stimpson, deceased, of Baltimore, Md., page 35, current volume, on harmonizing church bells, asks why the plan | having petitioned for the extension of a patent granted to the said James H. arrangement of the "merry sleigh bells " so as to produce concord rather | the 17th day of April, same year, for an improvement in vessels for holding liquids, for seven years from the expiration of said patent, which takes place owners themselves were compelled to make a selection from many on the 17th day of April, 1868, it is ordered that the said petition be heard at the Patent Office on Monday, the 30th day of March next.

> Stephen Bazin and James A. Bazin, of Canton, Mass., having petitioned for the extension of a patent granted to them the 25th day of April, 1854, for au improvement in machinery for laying rope, for seven years from the expira tion of said patent, which takes place on the 25th day of April, 1868, it is ordered that the said polition be heard at the Patent Office on Monday, the 6th

screwed the cutting head having cutters running in the shavings sox, B. The cutter head and cone form a hollow mandrel. A belt, C, leads from a pulley on the cone arbor to the shaft under the bed of the lathe, thus giving motion to the feed cone, D, and saw shaft, E. In turning handles-broom handles for instance—the sawed stuff is piled upon the rack, F. when a cam draws forward the frame, and the saw cuts off the sticks to the required length, while, at the same time, a gimlet at each end bores holes through the sticks. The frame then recedes and the mallet, G, operated by a cam, strikes the lower stick, driving it into the feed rollers, H, which are fluted, and draw the stick into the hollow mandrel, whence it passes, after being turned, to a second set of rollers, I. The rollers are adjusted to the size of the stock to be turned by set screws. The taper, swell, or other irregularity on the work is given by a pattern cam operating the upright lever, J, which actuates the ring case that governs vibrating arms in the cutter head. The connecting rod, K, through which the mallet, G, is

mallet can also, be moved as aid to the same result.

The regular size of the lathe turns from five-eighths of an inch to one and a half inches diameter. By having extra heads this limit may be greatly increased. The manufacturers say that one man, with this machine, can do at least the work of four men with the ordinary lathes. It is capable of turning nearly all sorts of handles, chair stuff, billiard cues, map rollers, etc., giving the work an excellent finish.

Patented April 17, 1866. All communications relative to his latter should be addressed to Finley & Co., Geneseo, N. Y.

Pierie Acid and Its Properties.

In a lecture delivered before the Society for the Encouragement of National Industry in France, Dr. Calvert, F. R. S., spoke of a curious application which has been made of the explosive property of its salts. During these last few years, the picrate of potassium has been employed in great quantities by Mr. J. Whitworth, for charging the bombs for destroying the iron plating of ships. When the projectiles thus prepared strike the iron masses, the enormous propelling force with which they are expelled from the gun is instantaneously converted into heat, and to such an extent that the ball becomes red hot, the heat decomposes the picrate of potash, and a violent explosion ensues, owing to the enormous quansition of vapors and gases which are thus produced in an instant of time.

Whilst the alkaline picrates are endowed with such formidable properties, they also possess others which are useful for the alleviation of human misery. Picric acid is an efficacious remedy in intermittent fevers. Persons affected with such types of fever, upon whom quinine has lost all its beneficial effects by continuous usage of it-and this is the case with some of our soldiers who return from India-derive, I am glad to say, wonderful benefit from the use of picric acid and picrates, as Dr. Aspland has proved to be the case at the military hospital at Dukinfield. The knowledge of this fact may be useful in districts in which poor populations exist, for it affords them a cheap febrifuge; and, moreover, picric acid is not dangerous, as arsenical preparations are, nor does it derange the stomach like quinine.

Diffusion.

Some very elegant and simple methods of exhibiting the phenomena of diffusion are given by Herr Merz in a recent number of the Journal für Praktische Chemie. A portion of the shell of an egg having been removed by the action of hydrochloric acid, leaving the membrane exposed, the egg is to be suspended in water from the arm of a balance, a counterpoise being placed in the opposite scale. In about half an hour the weight of the egg has sensibly increased, as the position of the balance beam will show, in consequence of the passage of water through the membrane. If, how, alcohol be substituted for the water, and the weights readjusted, so as to bring the beam horizontal, it will soon commence to move in the opposite direction, showing that the egg has become lighter by the diffusion of water into the alcohol. The diffusion of vapor may be exhibited by tying a diaphragm of

The rapidity with which many kinds of wood turning can vapor of this fluid will pass rapidly into the funnel, the air to the driving power as seriously to interfere with the equabe done by the automatic machinery now so extensively used | being observed to escape in bubbles in the water at the small | ble action of the machine. WILDER'S PATENT PUNCHING PRESS.

The power press has become a common tool in our machine shops. As usually built it has serious objections. It is used

of water. The funnel being inverted over a dish containing | good finish. The common power press is actuated by means | pair the colors or appearance

ether, which, however, the diaphragm is not to touch, the of an ordinary clutch which necessitates such a jar and jolt

the perspective, and Fig. 2 the sectional view. Mechanical perfection is not to be expected, but this machine seems to be capable of no very radical improvement. It is so designed that any size of press required can be made without any considerable change in the construction of the parts.

Fig. 1 is a perspective of the press, which, it will be seen, is of pleasing proportions. The power is applied to the wheel by means of a belt, and actuates the plunger in the usual manner, by cam or eccentric. The stop motion is very simple and smooth in its action. It is a sliding bar, A, at the top of the machine-seen drawn on a larger scale in the vertical section, Fig. 2-carrying a dog, which, when the plunger is at work, locks into a mortise in the revolving disk, B, Fig. 1. This stop motion adds no strain to the press when the machine is working, the strain or wear being no more than if there was no stop motion attached. It is held in a locked position by the foot on the treadle. C, and so long as the treadle is pressed down the press will operate, but if the foot be removed

operated, is coupled so as to be adjusted to any required | be curved inwards. These experiments are particularly in- | the plunger will instantly stop and always in the highlength of stuff, and the foot of the lever which holds the structive, and are within the reach of every one. The ballest position, an advantage of no little moment, as all ma ance may be extemporized by means of a light bar of wood. chinists know. By removing the foot from the treadle as soon as the plunger begins its downward movement, it will make but one stroke and will be unlocked by the dogs, D, Fig. 2, on the shaft and slide. The length of stroke is adjusted by the horizontal worm shaft seen on the front of the machine, and the stroke may be lengthened or shortened when the press is in motion as well as when at rest.

> Patented May 28th, 1867. G. & C. Place, 222 Pearl street, New York city, are the agents for this press. Communications respecting the machine should be addressed as above, or to Moses G. Wilder, patentee, West Meriden, Conn.

Artificial Meerschaum.

Vegetable ivory has long been known, but vegetable meerschaum, vegetable horn, or vegetable coral, as they may with strict propriety be called, are late acquisitions, brought before the public for the first time during the late Exposition. The mode of preparation of these substances is as follows: Common potatoes are peeled and macerated for about thirtysix hours in water acidulated with eight per cent of sulphuric acid. After this operation they are dried in blotting paper, and then in hot sand for several days on plates of chalk or plaster of Paris which are changed daily; being compressed at the same time, an excellent imitation of meerschaum, answering well for the carver, or any purpose not requiring a high temperature, will be obtained. Greater hardness, whiteness and elasticity will be produced, if water containing three per cent of scda, instead of eight per cent sulphuric acid is used. And if, after the potatoes have been macerated in the solution of soda, they are boiled in a solution containing nineteen per cent soda, a substance resembling stag's horn, and which may be used for knife handles, etc., will be formed. Turnips may be used instead of potatoes in the production of the artificial horn; and if carrots are substituted for the potatoes, a very excellent artificial coral will be obtained.

NEW METEOROLOGICAL INSTRUMENT.—Prof. De la Rive, of Geneva, has contrived an instrument for measuring the transparency of the atmosphere. The inventor agrees with Pasteur, who supposes that the light dry fog which under certain conditions of the air intercepts the light, is caused by myriads of organic germs floating near the earth, which are washed to the earth by the heavy rains, or are destroyed by severe frosts, thus accounting for the clearness of the atmosphere at these times. Convinced of the truth of these statements, a determination of the state of the air, it seems, would be of benefit in a sanitary point of view; hence the value of this invention. A complete description of the instrument has not fallen under our notice, but it principally consists of a double telescope with a single eye piece, by which two objects at known distances may be compared, and thus the transparency of a measured stratum of air is directly determined.

INCOMBUSTIBLE CLOTHING FOR WOMEN.-It is stated that no ballet dancer of the Queen's Theater, London, is allowed to dance in garments that have not been saturated with a India rubber-a portion of a small toy balloon will answer net only for perforating sheet metals, but latterly for finish-solution of tungstate of soda. This mineral is now extensivethe purpose—over the mouth of a funnel, the other end being ing the surfaces of forged pieces to give a better surface and ly used in the laundries of London. It prevents the fabrics in communication, by means of an elastic tube, with a vessel diminish the amount of hand work necessary to produce a with which it is incorporated from blazing, and does not im-

INVENTORS .-- THEIR OPPORTUNITIES AND INTERESTS.

weekly is sufficient evidence of the existence of a large amount of inventive talent in the country; that all these patents do not prove remunerative, or that some of them are improvements only in name, does not militate against this statement. Still, the long list of patents might be much further extended, we think, by the more general cultivation, by our mechanics, of a habit of close observation. An observing and reflective man, possessing natural mechanical capacities, can hardly pass through a workshop in any department of indus try, without seeing opportunities for improvement either in the tools and other appliances used, or in the methods of doing work. But it not unfrequently is the case that the mechanic who is constantly engaged on the work does not notice the room for improvement which the stranger sees at a glance; the familiarity induces indifference. Yet, the working mechanic is continually meeting with obstacles to rapidity and perfection of work, and in providing temporary expedients for relief, he may as well perfect them and make them permanent and valuable fixtures of the shop. If properly claborated and wrought out in the brain before being built he may find that in developing them he has unconsciously become an inventor-made a patentable and valuable im provement-where he looked only for a present aid, or a "make-shift." Perhaps the exactions of his business will not allow him to devote the necessary time and attention to the improvement, and he must content himself with getting up hastily a temporary aid to his work.

The number of patent claims published in our columns

But there come opportunities for this mental labor, which however, are not always embraced. Such is the present state of dullness in business. The enterprising mechanic whose ordinary work fails him, can profitably employ his otherwise unoccupied time in attempting improvements in the materials, methods, tools, or other appliances used in his business. If he is compelled to a state of comparative physical idleness, so much more room and opportunity is afforded for the exer cise of his mental powers. Plenty of instances of valuable discoveries, inventions, and improvements could be adduced to prove that such periods of enforced bodily inactivity have been advantageous to the observant and thinking mechanic.

It is the interest, also, of the inventor to make use of the means offered by our patent laws to secure to himself a portion of the advantages which his improvement possesses. A false idea of honor is that which either carelessly or supinely refuses to allow the inventor to reap a benefit from his improvement. He may consider it as not worth the expense time, and trouble necessary to make him secure as its origina tor; but if others deem it valuable enough to use, he should deem it valuable enough to be paid for. It is not the marked and notable improvement that is always the most remunera tive to the inventor, but often the little and seemingly unim portant advance on previous attempts, which proves a mine of wealth. If the inventor has any idea which he has so far brought toward a practical and visible form as to be understood, and which promises to be an improvement on processes, machines, tools, etc., it is his duty, as well as right, to secure his proprietorship by a patent at once. By this course he will be benefitted, while nobody will suffer an injustice.

CUMBROUSNESS OF TOOLS FOR IRON WORKING.

A correspondent insists that the massive lathes and enormous planers, etc., which are deemed requisite in the large machine-making establishments, where heavy work is done. are a waste of material, an annoyance by their excessive iron need be used than hitherto. weight, and unnecessary absorbers of power. He proposes

stead of the work brought to the tools.

Many years ago, we knew of a "big planer," got up by Mr. Seth Wilmarth, then of South Boston, Mass., the "feed" of which was a screw, we think sixty feet long, but which was cut on a ten or twelve feet lathe by being fed through a hollow arbor and delivered through another hollow arbor on the tail of the lathe. The consequence was a screw-fed planer which could not, at that time, be matched in the world.

Now, it seems that if a continuous screw could be cut on that lathe for that especial purpose, another screw might be cut, or a shaft be turned of any requisite length, on any ordinary lathe having proper heads.

sustain a load of thirty tuns, and which was run by a special steam engine, take off two chips at a time of seven-eighths of an inch in depth by over one-eighth in thickness. But all the mass of thirty tuns must be moved alternately back and forth, the machinery sustaining the immense shock of the weight and the inertia of the load in the change from one part of the reciprocating movement to the other. It requires power-its direct exercise and palpable expenditure - to run such a machine, while it seems as though the lighter weight of the tools and their head might be much more easily moved. In regard to the use of boring tools on a massive gear or pulley, the plan is already in practical use. If the boring machine (portable) is carried to the work, power is emitted from the boiler through pipes in the form of steam, or is taken from a convenient shaft by means of belts.

We do not believe in carrying so-called "improvements" so tar as to shock common sense by the advocacy of novelties which cannot be proved to be real benefits, but it does seem to be practicable to so adapt the proportions of work to be done to the tools to do it, that some, at least, of the heavy labor now really necessary in our large machine and engine shops might be avoided, and some of the power now expended saved.

COMPRESSED AIR AS A POWER.

The successful machinery used for tunneling Mont Cenis, in Switzerland (by which the water power of a mountain torrent is made to compress air, and this compressed air led by strong tubes in the tunnel is made to move the boring machines), has given occasion to some mechanical engineers in France to make plans for transmitting the water power of a river through air tubes to the adjacent city, and bring the tubes into the houses, as gas and water pipes now are, so that by turning on the supply of compressed air, the escaping air may ventilate the building, after moving small appropriate engines, and so serve for sewing machines, turning lathes, and many other kinds of machinery requiring so little power that the erection of a steam engine would be a needless expense. In many instances the total amount of work done at intermissions during a whole day amounts to only three or four hours, for which the steam engine is kept running ten hours; therefore a great saving would be accomplished with this power, which would be consumed only when real work is done.

At present steam power costs in France 62 centimes (12 cents in gold) per hour per horse power; the gas engines are said to cost 78 centimes; this new compressed air power, when steam engines are used to compress the air, will cost 67 centimes; and when water power is used it would come as low as from 12 to 16 centimes (about 3 cents) per horsepower per hour.

With the exception of a few weeks in dry summer seasons, an amount of water falls over the dam at Fairmount Philadelphia, representing several thousand horse-power, which perhaps could be utilized in the same manner, compressing air and distributing this fresh air through tubes to localities where small amounts of cheap power and good ventilation are needed.

Compressed air is now beginning to be used to dispatch letters and parcels through tubes. In Paris such a system is in operation, and in New Jersey one is in course of construction between the cities of Newark and Jersey City. In London even a passenger railroad is propelled through very large tubes by the same means. However, in all these instances steam is the initiative power used. At the late Fair of the American Institute an experimental machine of this kind by the same means propelled thousands of persons through a large tube.

NITRO-GLYCERIN---ITS USE, ITS DANGER---WHO SHALL DECIDE WHEN EXPERTS DISAGREE?

Although the existence of this substance, and a knowledge of its explosive nature, has been long known to chemists, it was only in the year 1864 that it was brought into public notice as a substitute for gunpowder. Consequently, all our practical acquaintance with its effects has been gathered within the last three years, and new facts are continually presenting themselves as its use becomes more and more general, which it is well to note.

The elements of nitro-glycerin separate with immeasurable velocity, and hence the violence of its explosion, which has of gunpowder. Other economical advantages over gunpowder, in mining operations, may be summed up as follows:

of ground, and fewer holes have to be bored to dislodge an equal amount of rock. Hence a dearth of miners may, to a

Nitro-glycerin does not take fire readily, and when lighted nitro-glycerin before the explosion took place. lathes with hollow arbors, planers where the tool, rather than burns but does not explode and goes out as soon as the flame of not explode and goes out as soon as the flame of not explode and goes out as soon as the flame.

the work, shall be moved, and drills brought to the work in- is taken away. The holes can be tamped without danger. After firing the amount of smoke is small compared with that of powder, so that workmen can go back immediately to the place where they have blasted without inconvenience. Finally, holes that have missed fire can be retamped and fired, an operation at present either impossible or accompanied with great danger.

Against these advantages, it appears that the gases formed during the explosion have an injurious effect on the organs of sight and respiration. In course of time, however, the workmen get accustomed to it, and it is no longer looked upon as one which need restrict its employment. Nitro-glycerin, further, freezes easily, and explodes on being sharply We have seen a planer, the movable bed of which could struck, but the latter proper'y is not more dangerous than the danger of gunpowder in taking fire readily and exploding.

The latest nitro-glycerin disaster that has come to our notice was the explosion at Newcastle, Eng. In the course of the inquest on one of the victims some interesting evidence was brought out. From the testimony given on that occasion by a Mr. Isaac Bell, whom Engineering seems to accept as good authority, it would appear that under a great variety of conditions this substance is liable to spontaneous decomposition. At ordinary temperatures this catastrophe may take place, and particularly is it dangerous if impure in composition. The gases given off, if confined to the vessel containing the liquid, exercise pressure on the remaining liquid, and explosion of the vessel is liable under the least shock or movement. If the explosive is brought from a cool to a warm place; if the substance be exposed to a temperature of 46° Fah., crystallization ensues; or if the temperature is high enough to cause ebulition, under any of these circumstances spontaneous decomposition would result.

The inventor of "blasting oil," Mr. A. Nobel, of Hamburg. asserts that nitro-glycerin can be stored for an indefinite length of time without deteriorating in quality, and that the peculiar property of not exploding by mere contact with fire, renders its carriage, storing, and handling very safe, even when in an explosive state. Mr. Bell, per contra, asserts that the compound is liable, from its specific gravity (which is 1.6) to explode from mere movement, and is consequently very dangerous merchandise for a railroad company to transport.

The former gentleman, writing to the London Times relative to the same Newcastle accident, bitterly complains that the introduction of this valuable explosive, owing to the accidents resulting, as he afterwards shows, from gross careness, has been systematically opposed, and thinks it high time that the public should know that nitro-glycerin has won its battle over prejudice, and obtained far to firm a footing in several countries ever to be banished from use unless it be by something better. The want of that useful knowledge has been the real cause of the late accident, for no one surely would attempt to store an explosive substance in a city unless unreasonable fear threw an obstacle in the way of conveying it to and storing it in its proper place. He says: "My own printed precautions, lately produced at the trial, best prove how strongly I object to that unreasonable mode of storing; but the puerile refusal to receive it in a powder powder magazine may place an agent in a very embarrassed situation. Instead of adopting every measure to paralyze the circulation of a powerful and useful agent, it were far better to follow the example of Mr. Warrington Smythe in enlightening the public as to its use, thus making it a beneficial instrument for the development of our mineral wealth.

"It not to be wondered at that the immense accidents of Aspinwall and San Francisco led to rigorous measures restricting the transportation of nitro-glycerin; but in Sweden and Norway that substance was already so favorably known and had got into such constant use, that the excitement abroad had no influence on the liberal regulations there, and until this day it is freely carried by rail in both countries, nor has it led to a single accident.

"In Germany, also, before the prohibition took place, thousands of parcels containing nitro-glycerin were sent by rail, without causing the least damage.

"On the other hand, we find upon inquiry that accidents have only occurred when nitro-glycerin was transported under a wrong declaration. Such was the case at Aspinwall and San Francisco, and it is only too natural that such unwarrantable neglect should lead to calamities. It is the same with gunpowder. Whenever people convey an explosive material the first thing they ought to know is its nature."

Then follows a list of nitro-glycerin accidents which have come to his knowledge, and in looking over the list it must be admitted that the substance has been very strangely abused

"In five cases congealed nitro-glycerin has been melted purposely over fire.

"In three cases a red-hot poker has been inserted into the oil in order to melt it.

"In one case a man kept a cartridge with a percussion cap and fuse affixed and lighted it in his hand until it blew off.

"In one instance a man stood watching the burning of a fuse inserted into nitro-glycerin, until it went off and hurt

"In one case a captain set fire to a sailing vessel with a been variously estimated at from five to ten times the force cargo of nitro-glycerin, and people went on board to extinguish the fire, but saved themselves, seeing what was the cargo, and the ship was eight hours on fire before it blew up, Fewer men are required for working the same sized piece which could not possibly have been the case with gunpowder.

"In one instance two workmen, while filling cartridges with nitro-glycerin at the light of a tallow candle, set fire certain extent, be remedied in this manner, and less steel and to some gunpowder strewed on the floor, but found time to save themselves and carry away considerable quantities of

were soldered under continual reports produced by the heating of drops leaking out, but caused no accident.

"In one case a captain of artillery was hammering on a shell filled with nitro-glycerin, until it exploded and killed him.

"In one case a man took to greasing the wheels of his wagon with nitro-glycerin, not knowing what it was, and it wentall right until it struck hard against something, and the wheels went to pieces.

"In one case it was burnt in a lamp, as an improvement on petroleam."

Last in the list comes the Newcastle explosion, which, it seems clear, was caused by the grossest violation of the print ed instructions. The cans containing the nitro-glycerin were opened with blows of a spade, and then thrown into a hole one upon another. From the shock thus occasioned the

explosion took place. the inventor protests against the very narrow view of trying bility to accidents. "There is," says he, "a very easy way narrowed their claim. That Burgess believed, when he took is to be stopped, we cannot possibly confine the community to those articles only which it is impossible or even difficult to abuse. Something must be left to the understanding, and it is an excellent regulator. Thus, for instance, phosphorus, one of the most dangerous poisons and combustibles, is in every child's hand, and yet does but little harm."

THE AMERICAN WOOD PAPER COMPANY AND THE FIBER DISINTEGRATING COMPANY.

A case of great importance to patentees, upon the validity of Reissues, and illustrating the importance of having a correct description of the invention in the original specification, has just been decided in the U.S. Circuit Court for the East ern District of New York.

In this case the American Wood Paper Company filed a bil against the Fiber Disintegrating Company to restrain the de fendants from the use of certain inventions for which Letters Patent had been granted to the inventors in this country and by them assigned to the complainants. The whole of the inventions related to the manufacture of paper pulp from crude vegetable substances by means of chemical agencies applied at a high degree of temperature in a vessel or boiler of peculiar construction.

The patents, five in number, alleged by complainants to have been infringed by defendants, were:

(1st and 2d.) Watt & Burgess patents, being two reissues (Nos. 1,448 and 1,449) dated the 7th April, 1863, of a single re issue, 5th October, 1858, of original patent, dated 19th August, 1853, for improvements in the manufacture of paper from wood.

The two reissues were one for the product obtained by, and the other for the process of treating wood so as to produce paper pulp by boiling in caustic alkali under pressure.

Mellier's patent, dated 7th August, 1854, for an improvement in making paper pulp from straw. The process being very similar to that described in the reissued patents of 7th April, 1863, and 5th October, 1858.

(4th and 5th.) For improvements connected with the machinery for the purposes of making paper pulp. But the only question of general interest to inventors is in connection with the reissues of the Watt & Burgess patents, and on the Mellier patent, to which we confine our report.

contains the following words:

"The shavings are then to be boiled in a solution of caustic our invention."

alkali is mentioned, but there is nothing whatever to indi- move when the first has completed its revolution, and follows cate that this boiling should be under pressure, but it states in the same manner as the other two, the action of the three "We have found it very advantageous to have a heating ap- producing a constant and uniform current. pulp should be heated by steam, or other convenient method, of wheels of irregularly oval shape producing a crank to the boiling point."

In October, 1858, Messrs. Watt & Burgess obtained a reissue of their patent, and their specification contains the following words:

stance to be heated; that is, its resinous or gummy nature, and boiling in a solution of caustic alkali under pressure is of considerable importance. By the words 'under pressure' scale."

under pressure.

(among other things), that the reissued patents of 1858 and 1863 were improperly issued, being for a substantially different invention to that described by the specification to the patent of 1854; and with regard to the Mellier patent, they alleged that as they treated bamboo and not straw, and that while Mellier claimed the employment of a pressure of seventy pounds, and a heat of 310° Fah., as the pressure used by defendant as denoted by the steam gage, never exceeded six ty pounds, they did not infringe on Mellier's patent.

It was argued by Mr. Jenekes for the complainant, and by Mr. Russell and Mr. Harding for the defendants. Mr. Jenckes contended that the reissue of the patents by the Commissioner was conclusive until reversed by a substantive proceeding for This list is published that these accidents may serve as a | the purpose; that the inventions therein described were those warning against similar attempts to perform these feats, but | really invented by Watt & Burgess, and incorrectly described in the first instance; and he very ingeniously argued that to check the career of any improvement on the plea of lia- by inserting the words "under pressure," Watt & Burgess of getting rid of them; we need only prohibit the use of out his English patent, that he could cover the open boiling steam, fire, poisonous substances, cutting tools, firearms, ex- process, as well as boiling under pressure. On examination, plosives, etc., and return to those days when ignorance and it was found that Coupier and Mellier, in 1851, treated wood safety went lovingly hand in hand. But unless civilization precisely in that way. His action was, therefore, exactly within the requirement of the law, that where by mistake a patentee has claimed too much in his original patent, he should surrender it and take out a narrower claim in his re-

The Court took time to consider, and on the 7th of January 1868, rendered a judgment of which the substance, so far as of importance from the point offered above indicated, is:

First, that the Watt & Burgess reissued patent (No. 1,448 is void, on the ground that it is impossible to consider that to be a new material, patentable as a new product, which is simply a substance long well known to exist in wood and other substances in a state nearly pure.

Second, that the Watt & Burgess reissued patent (No 1,449), is also void, on the ground that the process described is substantially different from any described in the original patent. And this decision, which seems sound from every point of view, serves to establish as a principle, that even though an invention be so undescribed and the evidence of actual invention at the date of application so clearly established before the Commissioner of Patents as to entitle the inventor to a reissue, that the reissued patent will be void if the invention described in it be the description of an invention essentially different from the one previously described.

Third, the Mellier patent was held to be good and a decree made in favor of complainants on the ground that the 70 pounds pressure mentioned by the inventor was evidently meant in accordance with the French method of reckoning, viz., internal pressure, from which one atmosphere has to be deducted to get at the pressure denoted on the steam gage, as was further apparent from the temperature given of 310° description sufficiently covered the treatment of bamboo, other plants, to the stalks of which the term straw is usually

Decree in favor of the complainants on the Mellier patent bill. Dismissed as to the others.

Rotary Ventilating Fan or Blower.

At the November meeting of the Massachusetts Institute of Technology, Mr. S. P. Ruggles exhibited and explained a model of the ventilating fan or blower, invented by himself, The original Watt & Burgess patent, of August, 1853, now in practical operation at the Institute and about to be Paris. A glass tube, having inserted in it two platinum introduced into the State House in Boston.

It consists of three floats of which one remains for a short of the vegetable substance operated on, can be only learned | becoming stationary. The object of the stationary fan is to by experiment. For deal or fir wood we find that a solu- act as a wall to prevent the air going back, and to cause the tion of alkali of the strength indicated by 12° of the English | air brought by the ascending float to pass upward through Hydrometer answers very well. The length of time neces- the passage which conducts it to the building. This action sary for this part of the process is somewhat dependent on of the floats is produced by the shaft which carries them, bethe nature of the vegetable substance to be heated. We find | ing made in three parts, one within the other, each carrying | of a revolution, then carries the body of air at a uniform August, 1853, their complete specification, which is dated the last quarter of revolution to the state of rest. When the their French patent, dated 27th September, 1853, boiling in | to move, to follow in like manner; the third float begins to |

paratus in the vats where the alkali solution is added; the This movement is produced by an ingenious arrangement motion. The fan at the Institute is vertical, ten feet in diameter, and ten feet high; it makes about twelve revolutions per minute, forcing out seven to eight handred cubic feet of air at each revolution; this amount must go forward and "The length of time necessary for this part of the process | never can go backward on account of the wall of the stationis somewhat dependent on the nature of the vegetable sub. ary float. It requires only about one sixth of the power re quired for ordinary fans of this size to move it.

Prof. Rogers alluded to the great number of rotary aspirators and blowers in use in Europe and this country, in ail is meant a pressure at, near or above 200° of Fahrenheit's of which centrifugal action from rapid revolution is dependmanufacture of paper made from wood or other vegetable blower had been used before the apparatus of Mr. Ruggles; by a change in its day of flowing.

substances by boiling in alkali under pressure; the claim in but in fans with two floats only, in which no provision can the second (1,449) being for the process of boiling in an alkali be made against the backward flow of the air. In Mr. Ruggles' invention, the use of three floats, by the novel and in-The defendants contended as to the Watt & Burgess patent genious arrangement of shaft and wheels, render this retrograde action impossible, as all the air drawn in can pass in no other than a forward direction, where it is required for

Preservation of Stone.

This subject, which has attracted the attention of so many chemists, seems now to have been brought to a very successful point. We have received some specimens of chalk treated by a process discovered by Messrs. Dent and Brown, of the Chemical Department, Woolwich. Their process consists in the application of a solution of oxalate of alumina to the stone. The experiments date from December, 1865, and the results they have now obtained are most encouraging. The process is applicable to limestone, dolomite, and chalk, and may, we think, be made subservient to the preparation of lithographic stone. Oxalate of alumina is readily soluble in water, and the solution, which is simply applied with a brush, is made of a strength varying with the porosity of the material to which it is to be applied. The specimens we have before us are left in the original condition at one end, and have been prepared with the solution at the other. The physical characteristics of chalk so treated are-lightness, the possession of a glazed surface approaching somewhat in appearance to marble, and greatly increased hardness; in this respect the stone is about equal to fluor spar, or 4 in Mohs' scale. Furthermore, the lime being transformed into one of the most insoluble and unalterable of its compounds, and the alumina being precipitated, the pores are filled with a substance almost unacted upon by water or by the impurities present in the atmosphere of large cities. We should be glad to hear that the discoverers had one of the experimental bays of the Houses of Parliament placed at their disposal. They might thus prove their process to be a formidable rival to that of their colleague Mr. Spiller which, according to present appearances, is likely to be the numerous schemes now sub judice at Westminster .- Chemical News.

PRIMITIVE GEOMETRY .- M. Lenormant, a member of the French Academy, has been devoting considerable attention to the study of an interesting papyrus, just added to the British Museum collection. This ancient relic contains a fragment of a treatise on geometry applied to surveying, including a description of the modes of estimating the areas of a square, a parallelogram, of various kinds of triangles, and of the computation of the area of an irregular figure by means of triangles, and of the volume of a pyramid, the whole being illustrated by appropriate diagrams. M. Lenormant, in a report to the Academy, refers the production of this papyrus to the period of the twelfth dynasty, which would be cotemporaneous with the reign of Solomon.

STEAM MAN .- A lengthy account is going the round of the newspapers of a wonderful piece of mechanism in the form of Fah., which, on the French scale, corresponds to 70 pounds a "Steam Man," invented at Newark, N. J., by one Zaddock pressure, meaning internal pressure. That, further, Mellier's Deddrick. We have taken the pains to investigate the truthfulness of the wonderful story and we learn that, alwhich is of the same natural order as the wheat, oats, and though an invention of the kind is in progress, it is far from being perfected; and we have the promise that as soon as the steam man is in a condition to travel we shall have an opportunity of witnessing it, and the liberty of explaining its construction and operation. In the mean time we advise our contemporaries not to get excited over the steam man for he is likely to remain harmless for the present.

ELECTRICITY IN A VACUUM .- A new apparatus for demonstrating the fact that the electric spark will not pass through a perfect vacuum has been contrived by M M. Alvergniat, of wires placed at a distance of two millimeters (three thirtyseconds of an inch) apart, is attached to a mercurial pneualkali, the strength of which, being dependent on the nature time stationary while the other two are moving, each in turn matic machine. After half an hour's action the tube is heated over charcoal to a dull redness, and the vacuum continued until a point is reached when, in spite of the slight distance between the wire points, electricity ceases to pass.

How to Hold Pearls.—It is stated that certain native artists resort to an ingenious plan for firmly securing in any deboiling in a solution of caustic alkali under pressure, of con- a float. From the condition of rest the first float begins to sired position such pearls as they wish to drill or work upon. siderable service. We do not claim this operation as part of move slowly, and gradualty increases in speed for a quarter | The gems are first fitted loosely in holes bored in a piece of soft wood. A few drops of water are then sprinkled over In an English patent obtained by Watt & Burgess, 1st speed for half a revolution, and then decreases in speed in them, and this penetrating the fibers, causes the wood to swell and the pearl is held as in a vise, but without marring 18th February, 1864, contains exactly the same words. In first float has completed a half revolution, the second begins it or in any way depreciating its value. After a time the water evaporates, the fibers gradually relax, and the gem is again set free.

ABSORPTION OF GASES BY SOLIDS .- Atmospheric air by passing through india rubber, Mr. Graham, master of the British Mint, has observed, becomes super-oxygenated, and will rekindle smoldering wood like pure oxygen. He has even collected this gas by creating a vacuum in a thin india rubber bag, which latter is kept distended by mechanical means. Mr. Graham states that gases passing through solid films are first condensed into liquid form within the substance, and then pass off on the other side by evaporation.

" WASHING-DAY SPRING."-A correspondent says that " in Saline county, Missouri, is a spring, a few miles from the Missouri river, which flows freely on Fridays, but is dry on every other day, and the people thereabouts call it washinged on; in the apparatus of Mr. Ruggles centrifugal action is day spring for this reason." From the above it would seem To the specification to the two reissued patents of 1863, the not the motive force, but the mass of air is drawn in below that the traditional washing-day, usually considered as folwords used are substantially the same, the claim in the first and forced or bucketed up, and delivered to the discharge lowing Sunday, is not recognized in Saline county. If the (No. 1,448) being for the product, viz., a pulp suitable for the pipe. The temporary stationary condition of a float in a fan spring was hereaway its usefulness would be much enhanced

The Public Clocks of New York.

Mr. D. W. Bradley, City Timekeeper, lately read an interesting paper upon Tower Clocks, before the American Institute, in which were the following remarks:-

" With all due deference to the philosopher who said that time is money, I would observe that time is improvement progress, science, art; and on the other hand it is idleness, dissipation, poverty, decay, ruin. As for its being money, let me remark that I have been experimenting with it these thirty is a fine instrument. It is exposed to a greater range of heat years, and have never succeeded in making it yield more and cold than any other clock in the city, yet keeps excellent than enough to keep soul and body together. We visit St. Paul's. The bell was new a year ago. The old one got cracked, and they set a man to boring the crack out. He worked a week or two, and nearly froze to death, and when he finished his work it was found that the crack was larger than ever before. So they put in a new bell. The frame of the clock stands five feet long, two feet three inches wide, and four feet high. The pendulum is of wood, 13 feet long, giving 32 beats, and the ball weighs 75 pounds.

" St. John's clock was built by Henry Harris, London, in 1812. It is nearly similar to St. Paul's, but is better finished, and has the worst escapement I ever saw.

"The clock of the Dutch Reformed Church, Fifth avenue

and Twenty ninth street, and that of St. Mark's, were made by Stokell. They are both like the clock of St. Paul's, though smaller and better. Stokell made some of the best egulators in this country. "Trinity cleck is the heaviest in America. The frame stands 9 feet long, 5 high, and 3 wide. The barrels are 20 inches, turning three times in 24 hours. The winding wheels are driven by a pinion and arbor. On the latter is placed a jack, or a wheel, a pinion, and a crank; 850 turns of the crank are required to draw up each of the weights. It takes 700 feet of 3-inch rope for the three cords; and the winding up of the weights consumes more than an hour of time, and requires the labor of two men. The pendulum is 18 feet long, and makes 25 beats. I cannot think that Mr. Rogers had a correct notion of what he was going to do when he began the building of this clock. At first it would not run 7 days, and he was obliged to put in new main wheels. The clock was at last finished, and an agreement was made with the sexton's son that he should receive 25 cents whenever it stopped, provided he at once notified the timekeeper but as it stopped every day, and frequently three or four times a day, the expense of feeing the informer became irksome to bear, and the cumbrous timepiece was placed in new hands. By this time it had gained a poor reputation, which clings to it even in our day. The weights are 800, 1,200, and 1,500 pounds respectively, and drop 50 feet. A large box is placed at the bottom of the well, which holds about a bale of cotton waste to check the fall of a weight in case of accident. Two years ago I wound it up on Saturday, and on Sunday morning the chiming cord broke, letting the 1,500 pound weight fall a distance of 50 feet, causing much damage. The cotton box was strongly braced on all sides, but the force of the blow burst it open. The contents were well scattered, otherwise the organ bellows, just in line below, would have contracted under a pressure somewhat greater than that which the "blower" was accustomed to exert upon them. A much better clock could be built of the metal contained in the frame and main wheels of Trinity's. None of these clocks keep accurate time. Trinity does best, the clock of the Dutch Reformed Church next. During the late heavy snew storm the north window in the clock-room of St. Paul's was blown open. The snow came in, partially covered the movement, and drifted down into the box to the depth of several inches, nearly covering the ball; yet the old pendulum waded through it with the glee of a school-boy, and stowed the snow on this side and that, and pelted it with such pertinacity that by the next morning the clock was 15 minutes ahead of time. The first warm day that followed, it fainted, and stopped running. There was an old German clock on the Post Office, but it was removed a long time ago. It had but one hand. Old St. George's clock is about 50 years old. It is smaller than the others, but has gained a reputation for accuracy. Twenty years ago a person who had not St. George's time was supposed, like a busy man, to have no time at all. As it is soon to be pulled down no care is taken of its inside, and the figures on the dial are grown so rusty that the time can only be guessed at. At the City Hall we find a good clock. The pendulum, 15 feet long, vibrates in 2 seconds. The ball weighs 300 pounds. To counteract the effect of heat and cold the compensation principle has been applied to this pendulum. The contraction of the iron rods which would draw up the ball is opposed by the greater contraction of the brass bar on which the ball rests, thus letting it down. When the rods expand the greater expansion of the brass bar lets it down-only it don't-that is, not yet. regulated it from June 1866, to February 1867, without moving the hands, but after the latter date, for three or four months, I set it every week although the variations never exceeded 30 seconds. The pendulum has not lost one vibration in more than two years. The new clock of St. George's, Sixteenth street, has never been excelled in finish. The frame is 8 feet long, 3 wide and 7 high. The main time wheel is 3 feet in diameter, has 180 teeth, turns once in 12 hours, has the figures on its face, and a pointer marking the hour. The second wheel is 27 inches, has 300 teeth, revolves every hour, and has the minutes on its face. The third wheel turns once in three minutes, and has the seconds pointed off on it. The pendulum is 35 feet long, and vibrates in three seconds, and the ball, weighing 390 pounds, is four feet in length by seven inches diameter. Two pinions and three wheels constitute all the machinary of this clock. Trinity's has five pinions and ten wheels. A duplicate of this clock is now being put up in the new arsenal at Rock Island. The clocks in the

Brick Church and that in St. Therese are small but good ones, if attended to. They are cared for by the sextons, and get no care at all. A gentleman from Pennsylvania was lately telling me about his wonderful one, which did not vary 15 seconds in a year. On questioning him as to the observations he was in the habit of taking, he remarked that he took observations every day, by a noon-mark cut in the floor of his back porch. The clock of the Third-avenue Railroad depot

[We gave a detailed description of the "new clock of St. George's, Sixteenth street," on page 80, Vol. XV., Scientific AMERICAN. The finish of that clock and the beauty of its construction is probably not excelled by any in this country, whether of domestic or foreign manufacture.-EDS.

OFFICIAL REPORT OF

Issued by the United States Patent Office

FOR THE WEEK ENDING JANUARY 14, 1868. Reported Officially for the Scientific American.

PATENTS ARE GRANTED FOR SEVENTEEN YEARS, the following

being a schedule of fees	-
On filing each Caveat	10
On allow each application for a Palent, except for a dealed	3.524
On bonday and oviginal Putent	ш
On appeal to Commissioner of Patents	DOM:
On application for Poissue	maria.
On application for Extension of Patcht	EM,
On granting the Extension	ш
On filing a Disclaimer	m
On flling application for Design (three and a half years)	ï
On aling application for Design (seven years)	220
On aling application for Design (fourteen years)	
Deciden	0.11

of Canada and Nova Scotia pay \$500 on application.

237 Pamphlets containing the Patent Laws and full particulars of the mode of applying for Letters Patent, specifying size of model required, and much other information useful to Inventors, may be had gratis by addressing MUNN & CO., Publishers of the Scientific American, New York.

73,220.—Holder for Drying Glue.—William Adamson,

Philadelphia. Pa.

I claim the within-described holder on which to dry glue, the said holder consisting of cords, wires, strips or sheets of suitable material saturated or coated with paraffine, or its equivalent, for the purpose specified. 73,221.—Connecting the Tubes with the Heads of Sur-

FACE CONDENSERS .- Horatio Allen, New York city. other, in the manner and for the purpose herein described.

2d. Also cutting and bending into bell-mouth form tongues in the ends of the tubes, for the purpose and substantially in the manner herein described. claim, 1st, Making one of the tube heads of greater inickness than the 3,222.—Horse Hay Fork.—D. W. Amos, Broad Top City,

Pa.
1 claim, 1st, The combination substantially as described of pivoted tines,
1 claim, 1st, The combination substantially as described of pivoted tines,

1 claim, 1st, The combination substantially as described of pivoted tines,
1 claim, 1st, The combination substantially as described of pivoted tines,
1 claim, 1st, The kain, B, for the purpose set forth.

2d, The arrangement as described of the link rods, C, below the joint of the nes, whereby the tork is opened by its own weight in descending.

3,223.—Horse Hay Fork.—Lewis Atwater, Ithaca, N. Y. I claim, 1st. The tines, C D, constructed in the form of books at their uper ends and branching below the said hooks to a broad bearing support near heir center and to double prongs at their lower ends, all in one piece, sub-

tantially as set forth.

2d. The combination of the levers, F G, and bail, A, all constructed and perating substantially as and for the purposes set forth.

3d. The combination of the tines, C D, levers, F G, and bail, A, arranged and operating substantially as set forth.

3,224.—CULTIVATOR.—A. Bennett, Rockford, Ill. Antedated

January 4, 1868.
I claim, 1st, The hitching iron, a. in combination with the plow beams, C.C., and the iront cross beam, D. arranged and operating substantially as and for e purposes herein described.
2d. Also the chain, h, with the stirrup, m, at one end, connected with the ow beams. C C, at the other end and passing over the rear cross beam, E, raise the beams and shovels, as described.

Sd. Also the upright hand levers, e.e. hinged or pivoted to the plow beams, C. and passing through the staples, gg, on the cross beam, E. to which they are secured by pins, kk, arranged and operating as and for the purposes

4th, Also the movable foot piece or steps, f. on the levers, c.e., held in place by notches in the sides of the levers, as and for the purpose specified 5th, Also the adjustable braces, p.p., and slotted bolts, r.r. arranged in restion with the beams, C. and standard, d. to regulate the pitch of the shovels, as hereic shown and described to be a property of the shovels, the property of the shovels.

3,225.—Sheep Wash.—E. B. Booth, St. Louis, Mo. I claim a sheep wash composed of the ingredients above named, or their

3,226.—Saw.—E. M. Boynton, Grand Rapids, Mich. I claim as an improvement in the construction of saws providing them of the gaging and clearing teeth, B. consisting of the included points, c, and the horizontal face or bearing, e, with a shoulder between the point and he bearing, e, substantially as shown and described.

3,227.—Saw Tang.—E. M. Boynton, Grand Rapids, Mich.

I claim the detachable saw tang consisting of the socket, A, with the arm, b having the groove, n, formed in its under side in combination with the lotted bolt, D, and the thumb nut, E, substantially as described.

3,228,—Shoe Holder.—A. N. Breneman, Lancaster, Pa.

I claim the arrangement of the toe and heel pieces, A.B., when connected by a hinge, C. in combination with the sliding wedge and band, D.E., or its quivalent, for separating the parts below, substantially in the manner and or the purpose specified.

3,229.—Spirometer.—G. W. Brown, Rockford, Ill. I claim, 1st, The arrangement of spirometers and index, R, and shield, I, in the manner specified and for the purpose as described herein.

2d, The metal tube, B, which rises through the water in the reservoir, A, Bd, The arrangement of the guides, E E, and eyes, F F, with spirometer, for the use and in the manner herein described and set forth.

73,230.—STRAP HOLDER.—H. W. Burgess, Ithaca, N. Y.

I claim, ist. The construction of the strap holder when the said surfaces of the movable piece or part, B, and of the bed or opposing piece or part, A, are made to be a part or section of the volute curve, F, as agured and de-

2d. The giving by the above-named volute-shaped surfaces an adaptation to varied thickness of straps and a parallelism to each other of the said surfaces thereby safely and surely holding the varied straps placed between the grasping surfaces, as berein described.

3d. The combination of the bad piece, A. movable piece or part, B. volute-shaped surfaces, F. handle, G. and hinge, D. the same making a strap holder, as set forth as an article of manufacture.

3,231.—Shovel Plow.—H.C.Chandler, Eric Township, Ind.

I claim, 1st, The notched beam at D, for the purpose of adjusting the handles to the desired hight, by a bolt passing through them and the notch.

2d, The double slotted wedge, F, and method of application at the point G, under the beam between the standards, B B, to adjust them as to whith, and he slotted rods, E E securing a forward or backward movement of the standards, B B, and the shovels attached thereto, and fastened to the beam in the slots by a bolt or other similar device. 3,232,—Balanced Feed Water Valve.—Geo. E. Cheno-

weth, Baltimore, Md.

I claim, in combination with the valve, valve-siem, and passages, an elastic, mermeable diaphragm, and air chamber underneath it, for the purpose of olding the valve in a calanced condition in any of the positions of the valve, ubstantially as herein described and represented.

3,233.—Apparatus for Determining Deviation of Loco-MOTIVE CRARE PINS PROM THOM CENTER .- Chas. J. Chifford, New Hamp-I claim the instrument for ascertaining, without quartering or centering, whether or not crank pins on locomotive driving wheels are bent or sprung, constructed with the arms, a, feet, b, brace, c, adjusting acrows and springmarking point, fig. 2, all arranged and combined substantially as shown and specified.

73,234.—Pole Attachment.—Geo. N. Compton, Canton, O.

I claim, 1st, The combination of the part, L. with the pins, a a, and the ring, G, the whole forming the ring pieces, L. G, shown in fig. 6, in the manner and for the purpose herein specified.

2d. The clevis, F, composed of the two U's, united by a bollow neck, and cast either in a stogle piece or in two pieces, which are connected by a bolt or rivel, in the manner and for the pieces, which are connected by a bolt or rivel.

or rivet, in the manner and for the purpose herein specified.

3d. The tongue shield, S. with pins, a a, thereon, constructed and arranged in the manner and for the purposes herein specified. 73,235.—Corset.—Clara Z. Cummings, Buffalo, N. Y. Ante-

I claim a corset having a portion of its back formed of clastic goods, B.

and provided with clastic buckle straps, C and D, for the purposes and subantially as described. 73,235.—CART HARNESS.—P. K. Curll, Elk Ridge Landing,

I claim a cart harness saddle, provided with the lever, D, pivoted in the up-er end of a bolt, C, said bolt being arranged to turn loosely in the cross-sece, A, all constructed and arranged to operate substantially as shown and ,237.—Loom.—John Deakin, Gloucester, N. J., assignor to

himself and D. and C. Kelly, Philadelphia, Pa.
I claim the combination and arrangement of the heddle levers, pattern hain, and adjustable cams, with levers, E.H. or their equivalents, the whole cing constructed and operating substantially as specified.
3,238.—CIRCULAR SAW.—Henry Disston, Philadelphia, Pa.

I claim a circular saw, every tooth of which has its back edge so formed in the arc of a circle, having a center eccentric with the center of rotation of the saw, that the sharpening of each tooth may be effected by reducing the front edge in a spiral course, as herein set forth. 73,239.—Saw Gumming Machine.—Thos. S. Disston (assignor

to Henry Disston), Philadelphia, Pa.
I claim, 1st. The rotary cutter, G. arranged to revolve in disks, adapted to and admitting of being turned in a suitable frame secured to the saw, all ubstantially as described for the purpose specified.

2d. The combination of the rotary cutter, G. its bearing blocks, D.D. adapted to the movable disks, B, all substantially as and for the purpose herein set

Ed. The rod, J, rendered adjustable on the machine, and having a notched and, adapted to the point of one of the teeth of the saw, as set forth for the 4th, The recesses, k k, in the disks, B, for the reception of the ferked end 73,240.—REGULATOR FOR TIME PIECES.—Samuel F. Estell,

I claim the combination of the regulating lever, C. baving a slotted end. in ombination with screw, F, and nut, E, substantially as described, and for

73,241.—AMALGAMATOR.—A. L. Fleury, New York city. I claim the herein described amalgamator, constructed and operating sub-

stantially in the manner set forth. 73,242.—Buckle.—George L. Gerard (assignor to himself and David Forbes), New Haven, Conn. Antedated Dec. 23, 1867.
I claim the combination of the central bar, f, and bars, h and l, and the rins, r and s, the whole constructed and arranged so as to operate in the manner

73,243.— MACHINE FOR SCOLLOPING LEATHER.— Andrew Goodyear, Albion, Mich.

Goodyear, Albion, Mich.

I claim, 1st, A cutting-edged disk, A, with radial corrugations or other ornamental shaped indentations formed around it on both its faces next the periphery, substantially in the manner and for the purpose herein described.

26. The use of one or more revolving cutting disks, A, with faces shaped radially in ornamental forms, in combination with an adjustable bed roller. B, and levers, L and M, mounted in a suitable frame and arranged, adjusted, engaged, and operated substantially as and for the purposes set forth.

73,244.—Neck Tie Fastening.—Robert A. Goodyear, New Haven, Conn. Antedated Dec. 28, 1867.

I claim the spring clasp, c, formed as shown at 1 1, for grasping the button, and so bent at or near the hinge, b, of the plate, a, that a spring is produced or accoping the plate, a, toward the clasp, as and for the purposes set forth. 3,245.—Anti-friction Bearing for Machinery.—John

I claim the glass bearings, B, in combination with the working parts of nachinery, A, flexible seat, d, arranged as set forth and for the purposes

3,246.—Composition for Preserving Wood, Metal. Canvas, ETC.—Louis Harmyer, Cincinnati, Obio.
I claim the composition itself, and the manner and process of compounding and using the same, substantially as herein set forth.

73,247.—AUTOMATIC ALARM FOR GRIST MILLS.—M. W. Hel-

ton and J. H. Redfield, Bloomington, Ind.

We claim, 1st, The apparatas substantially as described, and which is constructed so that when applied to mill machinery and properly adjusted thereto, it will automatically give an alarm at the proper time for changing the sacks, for the purpose set forth.

2d, In combination with alarm mechanism and devices which will automatically sound the alarm, and then be disengaged from the main driving power, substantially as shown and set forth, means, substantially as described, by which the machine can be adjusted and set to sound the alarm at any given time, for the purposes set forth.

at any given time, for the purposes set forth.

3d. The adjustable index wheel, K. with its stop, i, and pawl, m, or their respective equivalents, in combination with the hand or arm, L. upon the shaft, b, and an alarm mechanism, operating substantially as described.

4th, The vibrating lever, D, and catch, H, in combination with the tripping wheel, E, worm-wheel shaft, C, and driving shaft, B, operating substantially as described.

5th. The pawl and clamp, m s, or their equivalents, applied to the wheel K, or holding this wheel firmly in place when properly adjusted, substantially

6th, Sustaining the worm-wheel shaft, C, at one end, by means of a lever, D. in combination with a catch, H, and also with means for tripping this catch, when said shaft, C, has made a given number of revolutions, substan-73,248.—Horse Rake.—Benj. F. Horton, Ithaca, N. Y. I claim, 1st. The arrangement of the teeth, and the knobs projecting from the lower sides of the thimbles, B, substantially as described.

2d, The combination and arrangement of the described levers and rods, F

3 H I and J, substantially as set forth.
3d, The combination of the hand lever, J, rod, I, pivoted lever, H, rod, G, ever, F, and lifting bar, E, when all are constructed and operated substantially as described.

73,249.—Soda Fountain.—John S. Hull, Cincinnati, Obio.

1 claim the soda fountain, G, tubes, H I and J. and cooler, E, combined and arranged for ejecting the water by compressed air forced into the water fountain, substantially as described. 3,250 .- STEAM GENERATOR WATER GAGE, -John S. Hun-

ter, Hartford, Conn. I claim the arrangement of the three-way cocks, b and c, with their respective outlets, G, in combination with the tube, E, the connections, D, so as to operate substantially in the manner and for the purpose herein set

3,251.—MACHINE FOR HUSKING CORN.—H. W. Knowlton, Saratoga Springs, N. Y. Antedated Jan, I. 1868.

I ctaim the combination of the rollers. D. with the elastic aprons, K. on the rollers, I L. substantially as and for the purpose set forth.

73,252.—Generating Illuminating Gas.—Ferdinand King (assignor to himself and Charles W. Neudecher), Richmond, Va. 1 claim, 1st, The method herein described of generating or producing illu-

ed, Also the compound oil herein described, for the purpose set forth. 3,253.—Pump.—James McBride, Flint, Mich.

I claim an inclosed angular space around the pump cylinder, deriving a upply of air from the well, substantially as and for the purpose described. 3,254.—Animal Trap.—Oliver Metcalf, Salem, Ind.

1 claim, 1st, The combination of a catch, a, upon a hinged door, A', with the latch rods, f, upon the revolving platforms. C, substantially as descrived.

2d, The hinged platform, d, held up by a spring, g, and combined with the revolving platform, C, and apron, b, substantially as described.

3d, Connecting the platform, C, to the spring shaft, c, by means of a removable key rod, h, applied substantially as described. 73,255.—Pen.—Wm. A. Morse, Philadelphia,

I claim a fountain union pen, made of two parts, a c and F, the same being cjustable, and connected, substantially as described and shown, for the pur-73,258.—HAND LOOM.—Jas. E. Nute and Geo. H. Hathern,

Lincoln, Me.

We claim, Ist, The combination with the loom frame of the pivoted arms a', warp beam, C, rod, c' and eye, d', and screw nut, e', or equivalent, securing devices, substantially as described

2d. Combining with the treadles, H, the adjustable devices, herein described, for holding the shed pen till the reed beats up the thread, or which will allow the shed to close when the shuttle passes, when constructed and arranged to operate by means and in manner substantially as described and specified.

anism, substantially as described, so that the motor which drives the loom shall simultaneously operate the spooler, substantially as described.

4th, The spooler, as constructed, with the sliding serrated bar, s', slide, r', actuated by cam, z, or its equivalent, and withthe pawl, t', and eye, P', arbor Y', and support, w, or their equivalents, for suspending the bobbin, all constructed and arranged to operate in manner substantially as and for the purposes specified.

73,257.—Fence.—E F. Olds, Brighton, and Warren Clark,

We claim the special arrangement of the braces, C, in combination with the posts, B, when the said braces are connected to the post and to each other in manner and for the purpose substantially as described.

73,258.—Brick Machine.—S. J. Parker, Ithaca, N. Y. I claim, 1st, The perpendicular adjustable cam, C. in connection with the langers and movable wheel, arranged and operating together as shown and

ed pipe, G' G" G", in connection with each other, that nearly the entire arrace of each brick shall be subjected to the smoothing contact of metal,

3d. The arrangement of the adjustable auxiliary cam, N, in connection with the main cam, C, as and for the purposes described.

4th, The cutting wheel, X, arranged in connection with the feed pipe, G'', and feed plate, E'' as set forth.

5th. The secondary feed pipe. Z, and its side grooves, in connection with the feed pipe. G, and feed plate. E'', substantially as described.

6th. The combination of the wheel. A, on the horizontal shaft. L, adjustable nam. C, feed plates. E' E'' and E''', when substantially made, and operating as described.

7th. The combination of the wheel, A, on its shaft, L, adjustable cam, C, auxiliary cam, N, cam surface T a, plate, E', and table, H, arranged and operating substantially as described.

Sib, The feed plate, E' E'' E''', when made adjustable, and arranged with reference to the mold wheel, A, substantially as shown and described 73,259.—Apparatus for the Manufacture of Stakon.— John A. Owens, Little Falls, N. Y., assignor to himself and Henry I

I claim, Ist, The tank, A, with the shaft and arms, At, constructed and operating as described, and for the uses and purposes mentioned.
2d, The screen, C, constructed of the sloves, C1 and C2, and the incline

3d, Forming the front end of the sieves, Cl and C2, with the angle, C9, substantially as described, and for the uses and purposes mentioned.

th, Forming the end of the sieves, Cl and C2, with a curve, substantially as described, and for the uses and purposes mentioned.

73.260.-Fence.-M. D. Pratt, Copley, Ohio.

I claim the combination and relative arrangement of the stake braces, C, and short braces, D, with the rails, A, and posts, B B, in the manner herein shown and specified, the said stake braces being placed in the hollow of the angles of the fence, and alternating from side to side, as and for the purposes

73,261.—Temporary Binder.—N. M. Shafer, New York city.

Autedated January 2, 1868.

I claim, 1st. The series of clamps, A. A. intersected by the steel bars, E. bluging on the wille, B.

2d. The movable slide, C.C., and the lug or key, d. for securing the same.

3d. The back, to be used in the manner as set forth and described, in combination with the other parts.

73,262.—COMBINED LUBRICATOR AND WATER CONDUCTOR.—

T. A. Shock, U. S. N., Boston, Mass.
I claim the combined inbricator and water conductor, constructed substantially as and for the purpose described.
73,263.—HAY CRANE.—Matthew Simms and Jas. V. Cham-

We claim, 1st, The application and arrangement of the guys, C C C, in their connection with the ring, b, and collar, a, and pin, c, in combination with the movable post, A, arm, A, brace, C', and lever, D, when used substantially in the manner and for the purpose as herein set forth.

2d. The arrangement of the pulleys, F F, in combination with the post, A, and arm, B, when used substantially in the manner and for the purpose as herein set forth. bers, Wheeling, W. Va.

73,264.—Prow.—Stephen T. Skinner, Jacksonville, Mo. I claim, let, My forward upright frame, F, with swing bar, G, and flat chains, H H, for the use and purpose as specified and herein set forth.

2d. The attaching of my pole to the center, or near the left side of my machine, for the use and purpose as specified and herein set forth.

3d. My triple whitheree with the triple link, x, as represented in fig. III. for the use and purpose as specified and herein set forth.

3th, My crank axies, as made, attached, and operated on my machine, for the use and purpose as specified and herein set forth.

3th, My compound regulating shaft, X, with the revolving scekets, J, spring lever, K, and circle, L, for the use and purposes as specified and herein fully set forth.

sth. The combination of my crank axles, compound regulating shaft, X, and spring lever, for the use and purpose as specified and herein set forth.

Tih, My double crank shaft, M, with lever, N, and slings, Y Y, for the use and purpose as specified and herein set forth.

73,265. - Wagon Brake. - James Harvey Smiley, Caro-I claim, ist. The extension of the rear axie braces, M and N, behind the car axie, and susrension on the extremities thereof of the brake bar and

brake, as described.

2d. The construction of the metallic braces, S, from beneath the rear axle braces, in front of the bind axle, to the under side of the axle, and thence to the end of the braces. M and N, where they support these braces, and give bearings for the brakes and bar, as set forth.

2d. Constructing the joint between the tongue and reach by the loop on the end of the tongue rod, and playing in the slot, D a, of the plate, D, when arranged substantially as described.

4th, Constructing the tongue rod or bar, by the long part under the tongue, held by the loop near the yoke pin, and extending thence to the rear end of the tongue, where it makes the loop, C s, and thence is continued, over the top of the tongue, to the evener of the whiffletrees, and thus binding the lower part of the bar to the upper and the tongue, by the evener bott in its slot in the tongue, for the purpose of actuating the brake by the yoke pin, and releasing the brake by the whiffletrees, in the manner substantially as set forth.

5th. The combination of the forward and broad end of the plate, D, with the slot. D a, for the tongue and reach joint, and the slot for the king bolt, and connecting with the reach rod in the rear of the plate, as described.

6th. The combination of the bolt, E, in the holes, E E a E b, with the bolt and holes, F, for the purpose of lengthening the reach, as described. 7th. The combined whole, made substantially as described, for the pur-

73,266.—HAND LOOM.—Oliver Strong, Green Centre, Ind. I claim the tappet wheel, E. lever, F. pawl, G, and ratchet or cloth beam, the weighted lever and arm, the same being combined in the manner and constructed as and for the purposes substantially as et forth. 73,267.—Roving Frame.—William H. Thompson, Bidde-

I claim the combination of a series of flexible metallic bands with the transverse rail, E, substantially as herein described, and for the purpose spe-73,268.—Spring Bed Bottom.—J. D. Tifft, Cuyahoga Falls,

I claim the combination of sections, B'C', and independent frame, D, operated by the cord and pulley, and hinged to section, C', all in the manner as and for the purpose set forth. 73,269.—MACHINE FOR POLISHING THREAD.—William W.

Trapp (assignor to Tobias Kohn), Hartford, Conn.

I claim the guides around which the threads pass, arranged substantially as described, in combination with the reciprocating rubbers, so that each thread in its travel shall present two parts moving in opposite directions to the action of the rubbers, substantially as and for the purpose described. 73,270.—MACHINE FOR TWISTING WAX ENDS.—Francis K.

I claim the arbors. D. provided with the spring clips for holding the threads, and pulleys for imparting motion, in combination with the driving pulley. C. all mounted in the frame, B, and arranged to operate substantially and for the purpose herein set for

73,271.—FRUIT JAR.—E. B. Whitmore, Rochester, N. Y. I claim the double bowed bail, C. provided with the finger places, h h, and spring bends, i k k, constructed and arranged substantially as and for the

73,272.—Machine for Filling Paint Cans.—John Wilcox,

Springfield, Mass.

I claim, let, The adjustable wing, q, when constructed and arranged substantially as described, and for the purpose specified.

2d, Also, the movable collar, M, in combination with the wing, q, shaft, J, and tube, a substantially as described, and for the purpose specified.

3d, Also, the angle-box, D, when recessed as described, in combination.

with the tube, a, and cylinder, E, substantially as described, and for the pur

ith, Also, the cylinder, E, when constructed with a shoulder and side aperture as described, in combination with the angle box, D, packings, c c', nut, e, and check nut, e', substantially as specified, and for the purpose set forth. 5th, Also, the packings, c c', when constructed and arranged in the manner described, and for the purpose specified.

purpose set forth.

The Also, the rost, G, constructed and arranged as described, and for the purpose set forth.

The Also, the stops, it', in combination with the slotted rest, G, rod, b, and pin, s, as and for the purpose specified.

Sth. Also, the rod, b, when provided with a pin, s, in combination with the rest, G, plunger, H, and cylinder, E, substantially as described, and for the purpose specified.

73,273.—Weighing Scale.—J. D. Willoughby, Shippens-

burg, Pa. Antedated, December 28, 1867. I claim the spring, i, or its equivalent, in combination with the scales, for the purpose set forth. 73,274.—Scaffolding Bracket.—John S. Wilson, Indian-

spolis, Ind.

I claim the bracket for scaffolding, composed of the elements, A B C, and D, constructed and arranged substantially as and for the purpose set forth.

73,275.—FRICTION MATCHES.—Benjamin F. Woodside, Mc-

Donald, Tenn.

1 claim, ist, A twine or cord, coated at intervals with igniting composition as a series of friction matches, substantially as above described.

2d, also, such twine, in combination with a spool, or wound into a ball,

substantially as specified.

id, Also, the case, D, in combination with the continuous match, substantially as specified. tth, Also a twine, or other suitable material, when waxed, and forming a continuous flexible taper, substantially as set forth.

73,276. — RAILROAD SNOW PLOW. — John Resco Adams,

Cisco, Cal.
I claim, 1st. the dash board or share, G. and the false bottom or slide, F., operated by the hand-wheel, g., and cord or chain, g', substantially as and for the purpose specified.

3d, The bonnet or gate, E. for retaining the load upon the incline, and the hand-wheel and plus, b, pawl d, and cord or chain, b', for raising or lowering said bonnet, substantially as described; and

31. The side pieces, D and D', movable in the ways, 111'1', substantially as and for the purpose described.

and for the purpose described.

ttb. The platform, C, upon which the hand-wheels are placed, as described. 73,277,-GATE.-Ralph Adams, Ottawa, Ill.

I claim, let, The levers, L, and rods, R, in combination with the rack, E, substantially as shown, for the purpose of opening a gate, all as set forth.

2d, The latch bar, P, and cord, m, in combination with the levers, L, substantially as shown and for the purpose specifies.

2d, The pawl, v, in combination with the levers, l and L, and notch, f, for the purpose of holding a gate open, substantially as shown.

73,278.—LAMP.—John Allen, New York City. Antedated

I claim the combination of the conical holder of the non-conducting material compartment, C, with the wick tube, B, when constructed as herein described, for the purposes set forth,

73,279.—Bit-Stock.—Charles A. Amidon, Greenfield, Mass. of to move away from or toward each other in the manner described, so that equivalent, to force the said jaws upon said shank, as and for the purpose set | forth.

This jaws, G G, constructed with the groove, formed substantially as set forth, so as to enclose the taper sides and the shoulders of the shank, as and for the purpose described.

The cavity D, formed with a beveiled orifice, as shown, in combination with the jaws, G G, constructed with correspondingly beveiled ends, as and for the purpose shown and described.

73,280 - Exhausting Ventilator and Chimney Cowl .-James W. C. Anderson, (assignor to Henry Demarest.) New York, City.
I claim, lat, The collar or water stop, a, arranged relatively to the cone, B.
and body. A, substantially as and for the purpose within set forth.
Di. Also, the within described construction and arrangement of the body.
A, incline, B, connection, C and holes, D and E, as and for the purposes

plane, C5, substantially as described, and for the uses and purposes men- 73,281.—MACHINE FOR MAKING CHEESE.—B. Armstrong,

Huntsburg, Oblo.

I claim, lst, the cylinder, E, provided with cutters, I, in combination with the mouth, K', and case, D, as and for the purpose substantially as set forth.

2d. The shell or case, D, and projection, X, constructed and arranged, in relation to the cylinder, E, and cutters, substantially as and for the purpose id, The ring, G. in combination with the cylinder, E, and case D, as and

78,282 -RAILROAD RAIL -Peter Ashcroft, Richmond Road, Dalston, and George Frederick Lee Meakin, London, England,
We claim a compound steel and wrought iron rail, in which the adjacent
(or bearing) vertical surface of the steel and iron portions are formed with
angular interlocking ribs and grooves, and the upper faces of the iron plates
and lower faces of rail head form taper bearings, all substantially as de-

or the purpose set forth,

73,283.—AIR CONDENSING APPARATUS.—H. J. Bailey, Pitts-

burg, Pa.

I claim, Ist, the combination, with a vessel for receiving and retaining air and retaining air under pressure, of two vessels for receiving air and water alternately, co-operative by means of cylinders, pistons, and pipes, for the purpose of condensing air, substantially as described

20. In combination with the apparatus above named, an eight way cock or valve, and a three way cock or valve, substantially as shown and described. Valve, and a three way cock or valve, substantially as shown and described. Sd, A condensing apparatus, to which air or water may be applied, for working the valves, and thereby rendering the operation of the same self-setting or automatic, in the manner described.

The present ND — N. Gray Bartlett, Keokuk, Iowa.

73,284.—INKSTAND.—N. Gray Bartlett, Keokuk, Iowa. I claim the overflow chamber, D, in combination with a fountain inkstand, substantially as herein shown and described.

73,285.—EYE GLASS AND SPECTACLE.—J. J. Bausch, Roches-I claim the combination of the connecting spring, C. guards, D, and plates, E, adjustably attached to the bows, B, substantially as described and for the

73,286.—Harness Attachment.—W. W. Beebee, Dubuque, lowa. I claim an attachment for harnesses, substantially as and for the purpose

73,287.—Water Proof or Damp Proof Paper.—Samuel C. Bishop, (assignor to Bishop Gutta-Percha Company,) New York City. I claim a damp proof paper, prepared with valata or balata gum or milk, a any way, substantially as herein specified.

73,288.—Water Proof Cloth.—Samuel C. Bishop, (assignor to the Bishop Gutta-Perch Company,) New York City.
I claim a water proof cloth prepared with valata or balata gum, or milk applied to or used in connection with cotton in any suitable way, substantially as specified.

73,289.—Plier.—James Bounds, Bridgeport, Conn. I claim the adjustable jaw, d, dog, g, shanks, A B, and link, e, the whole being constructed and combined substantially as herein set forth and de-

73,290.—Instrument for Drawing Ellipses.—Franklin Bowly, Winchester, Va.

I claim the combination and arrangement of the slotted handle, A, the marking bar, B, the sliding rods, C D, and the connecting rod, E, constructed and operating substantially as and for the purpose herein described.

Legge C. Royd, Milroy, Ind., assignor

73,291.—Cultivator.—Jesse C. Boyd, Milroy, Ind., assignor

to himself, C. P. Wilson, and L. L. Boblet.

I claim the arrangement of the beams, D, with their attachment directly to the axle, A, by means of shifting clevises, with handle, H, bar, I, and bars, F, and G, the several parts being constructed and operating substantially as and for the purpose specified. 73,292.—Refrigerating and Condensing Apparatus for

PRESERVING ANIMAL AND VEGETABLE SUBSTANCES.-Edwin D. Brainard, Albany, N. Y.

I claim, 1st. the combination of the drip gutters and condensing and refrigerating troughs or condensers, forming the ceiling of a chamber, constructed and arranged substantially as described, and operating as and for the purposes herein set forth.

2d. The method of forming the condensing troughs, by uniting the sides to a cap with closed double seams, substantially as described.

73,293.—Shaft Coupling.—James Brayley, Buffalo, N. Y. I claim providing the guard ring, A, with concealed recesses, g h, on its interior surface, or receiving the ends of the loose pins, e e, in combination with the holes, i, and openings, ii. of the forked heads, B, constructed and arranged substantially as and for the purposes set forth. 3,294.—Apparatus for Raising Sunken Vessels.—John

Burger, (assignor to himself and Albert Manvil.) Edzabethport, N. J. Antedated January 4, 1868.

I claim, 1st, the envelope, C, constructed and applied to the hull of a ves sel, substantially as described, in combination with a suitable binding cable, substantially as and for the purpose specified.

2d, The construction of the binding cable, D, in two or more sections, of India rubber or like elastic material, substantially as and for the purpose

3d. The frame, B, arranged upon the hull of the vessel, and in combination with the envelope. C, surrounding the same, substantially as and for the pur-

4th, The supplemental sheet or wing, E, arranged in relation with the envelope, C, and the hull of the vessel, substantially as and for the purpose

5th, The anchors, G. straining cables, F, and pulleys, h, arranged in relation with each other, and with the hull of the vessel, the envelope, C, and binding cable, substantially as and for the purpose specified. 73,295.—Car-Truck.—Henry T. Carter, St. Louis, Mo.

I claim, 1st, a car truck, constructed as described, with braces or bars, B B', having slotted extremities connected by pins or bolts, substantially as and for the purpose set forth.

2d, In combination with the above, the sliding bar, H, rods, d d' and e, and their connections, substantially as described. 73,296.—Postage Stamp.—Samuel Carusi, Washington, D.C.

I claim constructing a postage stamp, as described, with a blank space upon its face, for the purposes set forth.

73,297.—HINGE.—Samuel A. Chapman, Waterbury, Conn. I claim, 1st, an iron hinge wrapped or covered on its edges and faces with

heet brass, substantially as described 2d. In iron hinges encased by sheet brass wrappers, burring or sinking said wrappers into the screw holes of the hinge, for the double purpose of preventing exposure of the iron, and of holding or securing the wrappers, essentially as specified.

73,298.—Tweer Iron.—Robert W. Clark, Pittsburg, Pa. I claim, 1st, the combination of the air chamber, A, removable top, B, and keys, C C, when the same are constructed and arranged substantially as de-

2d, The combination of the air chamber, A, turning valve, E, and removable top, B, when the same are connected and arranged substantially as de-73,299.—Seaming and Bag Cutting Machine.—John Col-

lins, Jr., and Nicholas K. Nixon. Richmond, Ind., assignors to N. R. Nixon, Thomas Nixon and Alian T. Bennett.

We claim, 1st, the combination of the beits, F. F., G. G., H. H., and I., and their supporting rollers, as and for the purposes shown and described.

2d. The cutters, K. K., arranged and operating between the belts, substantially in the manner and for the purpose specified. 3d. Also, a series of knives or cutters in combination with alternate double

belts, substantially in the manner described, for the purpose of cutting rags into strips of any desirable width, to be woven into carpets. 73,300.— FRUIT BOX.— Ira Copeland, North Bridgewater,

I claim a box, in which the cover is secured to the body by means of one or more elastic media, arranged so as to operate substantially as described.

Also, providing a cover, when secured as described, with cross pieces on its outer surface, so that said cross pieces serve to keep apart the bottoms and tops of adjacent boxes when packed in crates, and thus permit circulation of air between the boxes, and also serve as feet for the boxes to rest upon when the cover is secured beneath the box, as in filling, or when used

as a show box, and prevent injury to any marks or labels which are upon the outer surface of the cover.

Also, in combination with a box in which the cover is secured as described, and with such cover, the dowel or steady pins and holes, substantially as and for the purpose specified.

Also, in combination with elastic media, secured to the sides or ends of boxes substantially as described, cross bars, or slats, or strips of wood, or other suitable material, which serve to reduce the length and cost of the elastic.

73,301.—Low Water Detector for Boilers.—C. F. Cos-

feldt, Jr., Philadelphia, Pa.
I claim, Ist, the arrangement of the levers, G H, and valve, D, constructed a betantially as herein set forth.
2d, The combination of the set screw, I, with the levers, G H, and valve, D ubstantially as herein described.

73,302.—Device for Straining Wire Fences.—F. H. Crandsll, Ontarie, N. Y.
I claim the threaded bolt, C, constructed, arranged and applied substantially in the manner and for the purposes herein set forth.

73,303.—MECHANISM FOR OPERATING SEWING MACHINES.—

Gustavus Cuppers, New York city.
I claim, I, The combination and arrangement of the shaft, a, of the spring sower mechanism, with the crank shaft and connecting rods for operating the needle arm, shaft for operating the feed and hook, and brake for regulating the needle arm. ng the movement of the said parts, in the manner herein shown and set

2d. The employment, in connection with the needle bar, of the movable weight or counterpoise, applied to the said bar, substantially in the manner and for the purposes described. ser of the bit shank, the screw thimble, F, or its shaft for actuating the feeder and shuttle, substantially as shown and set

73,304.—Device for Holding Boots and Shoes.—Henry T.

Dillon, Big Lick, Va.

I claim, ist. The standard, A, provided with two shanks, d d', the levers, R and O, and the hinges, h, supported by the brace, N, by means of the collar, c, as constructed, and for the purpose specified.

2d. The standard, A, in combination with the ratchet, M, and the adjustable standard, B, as and for the purpose set forth

3d. be standard, A, when used in combination with the standard, C, and its ratchet, f, as is hereto fully set forth. 73,305.—Sash Stop.—Bartlett Doe, Boston, Mass.

the purpose specified.

Also, the bent wire link, b, when applied to the hollow bolt and lever, substantially as set forth.

73,306.—ORE CONCENTRATOR.—Henry Donnelly, Virginia I claim, lat, The concave, reversible shaking tables, C.C. attached to and operating upon the opposite sides of the shait, B, together with the trough, A, substantially as and for the purpose described.

2d. The key, c, and the spring, d, together with the arms, a a' b b', loosely attached to the shaft, B, for the purpose of reversing and locking the tables, substantially as herein specified.

73,307.—SEEDING MACHINE.—P. A. Downer and A. P. Stuart, Monmouth Towards, Lower Land 1985.

Monmouth Township, Iowa.

We claim, 1st, In a seeding machine, having a revolving cylinder, the combination of the sliding head, E. disk, et, slide, g. lever, h. and standard, b. all arranged and operating substantially as and for the purpose described. 2n. The cleats, d', constructed and applied substantially as and for the pur-

3,308.—Freight Car.—S. W. Downey, Piedmont, W. Va. I claim the construction and arrangement of the hinged top or roof. in combination with the car, A a, and rail or rod, C, when the same are constructed and arranged substantially as described, and for the purpose speci-

73,309.—Fire Proof Safe.—Ebenezer D. Draper, Hopedale,

and Edward W. Glover, Medford, Mass. We claim the combination and arrangement of a heat non-conductor, c, of mics or its equivalent, with each or either of the metallic jambs or sides of the door frame, and the filling thereof, the whole being substantially as and

for the purpose specified.

Also, the combination and arrangement of one or more strata of fusible metal, d, with the mira or heat son conductor, c, arranged in a safe, substantially in manner and for the purpose specified.

Also, the combination and arrangement of mica, or its equivalent, or of mica and fusible metal, with the sides of the burglar proof and the next adjacent internal surfaces of the safe, the whole being substantially as specified.

73,310.—Carpet Stretcher.—A. L. Dunbar, Sheldon, III. I claim the carpet strercher, constructed as described, consisting of the sections, B, of equal length, pivoted together, said stretcher provided at each end with a toothed head, whereby the carpet can be stretched to be nalled down upon two sides of the room at once, without removing the stretcher. as herein shown and described.

73,311 —Safety Plug for Boilers.—Theodor G. Eiswald, Providence, R. I. I claim fusible plugs, constructed substant ally as shown and described.

73,312.—GATE.—Lewis Essig, Canton, Ohio. I claim, 1st, The opening and closing of any farm or other gate, A, by means of the windlasses, b, and ropes, H, H1 and H2, substantially as shown and described

2d, The windlasses, b, and the ropes or chains, H, HI and H2, and the pulleys, E and E', in combination with each other, and in combination with the posts, G, and the post, B, and any gate, A, substantially as shown and described, and for the purposes set forth.

3d. The slotted cap, e, in combination with the gate, A, substantially as shown and described, and for the purposes set forth.

73,313.—PORTABLE SHADE AND SEAT.—Dana Estes, Newton, assegnor to himself and Casper W. Boeth, Boston, Mass. Antedated Jan.

I claim the combination of the adjustable rail, C, and the posts, B B. provided with notches, a, as set forth, with the settee or seat, A, and the awning, D, applied therto, by means and so as to operate as specified. 73,314.—Harvester —D. S. Fisher, Cedar Spring, Ind.

I claim, 1st. The combination of the caster wheel, C. pivoted adjustable standard, a, pivoted arm, b, pivoted bar, d, and perforated horizontal seg-ment plates, D, whereby the rear end of the frame and cutters is raised and owered, and the direction of the harvester changed, as herein shown and

2d. The combination of the projection. ax, grooved wheel, l, spring, m, lever, T, pendent arm, U, crang, mx, shaft, V, rod, p, arm, q, rod, W, and finger, n, as herein described, for the purpose specified.

3d. The combination of the pivoted shaft, M, frame, L, and lever, Q, with the vibrating arm, N, having the pivoted head. O, and rollers, P, the lever, E, and connecting rods, J, all constructed and arranged as described, whereby the vibrating arm is thrown in and out of gear with the driving wheel, B, as herein shown and described, for the purpose specified.

73,315.—BAGGAGE CHECK.—Edward Flather, Bridgeport, Ct. Lelaim the indicator arm, C, revolving on the set server or river D, and

I claim the indicator arm, C. revolving on the set screw or rivet, D. and their equivalents, in combination with the disk, A B, substantially as herein 73,316.—Pump.—Robert M. Fryer, New York city, assignor

to Universal Pump and Manufacturing Company.

1 claim, 1st, The vertical chambers, D', having sediment chambers, E E', vertical cylindrical chambers, P P', with conical tops, U U', and disphragm chambers, F F', in combination with a horizontal cylinder, A, arranged as described, and operating in the manner set forth.

2d, The arrangement of the valve chambers, S', T and K, in their relative positions one to the other, to operate substantially as specified.

73,317.—THILL COUPLING.—W. W. Goff, Avoca, N. Y.

I claim the bolt, A, sliding hook, B, and India rubber ring or spring, when combined substantially as and for the purposes set forth. 73,318.—METHOD OF STOPPING CREVASSES.—Louis A. Gossin. Parish Lafourche, La.

I claim the construction and arrangement of the boat, A, and piles, F, in the manner and for the purpose substantially as herein set forth. 73,319.—Potato Digger.—John H. Gray and Charles W. Calhoun, Florence Township, Michigan.
We claim the construction of the machine, with the inner trame, b b, hinged to the front end, with the scoop attached, in combination with the other devices, as shown and described.

73,320.—ELASTIC COUPLING FOR SEEDING MACHINES, ETC.— A. P. Green, Stueben, Ohio.
I claim, 1st, The shank, C. provided with shouldered collars, D. in combination with the ring, E. elastic filling or ball, F. in the manner and for the pur-

pose set forth. 2d, The thimble or sleeve, G. arms, H. in combination with the ring, I. washer, J. and clastic filling, F', in the manner and for the purpose substancially as set forth.

73,321.—BARREL HEADING, CIRCLING, AND BEVELING MA-CHINE.-Remig Grotz, Chicago, Ill.

CHINE.—Remig Grotz, Chicago, Ill.

I claim, Ist, The frames, J, with their clamping devices mounted on the central pivot. D, and the operating devices, so arranged that as one is moved to the saw the other shall move from it, substantially as described.

2d. The pivoted sleeve, D, provited with the slotted arms, F, for supporting and adjusting the frames, J, as described.

3d. The adjustable locking levers, p, arranged to operate as described, for the purpose of holding the frames in position, as set forth.

4th, The clamps, M, having the adjustable segments, O, with the springs, k, applied to plates, P, in combination with the square mandrel, h, with the spring, I, and cam lever, N, applied thereto, all mounted on the arm, I, of the swinging frames, J, when arranged to operate substantially as described.

78.322.—Schution for Treating Vegetable Fires your

73.322.—Selution for Treating Vegetable Fiber for THE MANUFACTURE OF VEGETABLE PARCHMENT .- STUART GWYDD, NEW I claim the mode of producing the fluids numbered (1) one and (2) two, substantially as described, to be used consecutively in transforming celimiose into "vegetable membrane."

Also, fluid number one, produced substantially as described, as a "new composition of matter." Also, fluid number two, produced substantially as described, as a "new omposition of matter." Also, the use of these fluids, produced substantially as described, in comtination with machinery and apparatus, hereafter to be patented, for manufacturing celiulose, in the form of "vegetable felts," into a "new composition of matter," to be patented under the name of "vegetable membrane."

73,323.—Corn Sheller.—J. R. Hamilton, Portland, Oregon. I claim, 1st. The apparatus, as constructed, with a series of rowers, a a a, arranged in a circle, also the scrapers, f f f, in the rear of the rowers, substantially as and for the purpose herein set forth.

2d. The rowers, as arranged alternately, the one forward of another, the same being pressed by springs toward the center, so as to act as a wedge, psrallel with, between, and under the rows of corn.

3d. The sliding plunger, H, to push ears of corn between and through bars a a s a, with the rowers or points, b b, attached either vertically or horizon tally, as and for the purposes herein set forth.

73,324 — LAMP CHIMNEY CLEANER. — Jonathan R. Hamilton Portland, Oregon. I claim, 1st. The scrubbers or wipers, A A' and C C, when constructed and applied so as to operate substantially in the manner as and for the purposes herein set forth.

Also, the wiper, as constructed, in combination with the gear mechanism for operating the same, as specified. 73,325.—Window Sash Fastener.—John W. Hansel, Peo-

I claim the combination of the weight, A, on the bolt, B, with the arm, C, on the lever, D, operating together substantially as and for the purpose here-

Also, one or more spurs, s.s., on the upper edge of the bolt, B, in combination with its mortises in the window frame, with the said weighted bolt and the fluted lever, D, operating substantially as described. 73,326 — STEAM COMPRESSER FOR VULCANIZING FLASKS,—

Geo. E. Hayes (assignor to Buffalo Dental Manufacturing Company), Buffalo, N. Y. falo, N. Y.

I claim, 1st. The process, substantially as berein described, of closing the flasks under pressure of steam or vapor, during the operation of vulcanizing the rubber in the molds, by means of a steam ram or compresser connected with the flasks by a clamp or otherwise, and having the heat necessary to effect vulcanization transmitted through it in such manner as that the steam which is thus derived from a vessel that is distinct from the vulcanizer, though arranged within the latter, operates to close the flasks in advance of outside steam pressure on the latter, and while the rubber is at a comparatively low temperature, and plastic, essentially as berein set forth.

Id. The steam compresser composed of cylinders, A and B, in combination with a suitable clamp for holding the flask sections in connection therewith.

with a suitable clamp for holding the flask sections in connection therewith,

substantially as specified. 78,327.—Churn.—A. J. Heavner, Time, Ill.

I claim, 1st. The double dasher consisting of the parts, D E, constructed and arranged substantially as described to work one within and through the other, as specified.

2d. Also the double dasher consisting of the parts, D.E. operated by the double crank, G.H., through the medium of the connecting rods, F.I., substanitally as described and specified

73,328.—Boot Heel.—Gottlieb Henning and Herman P. Willie, Buffalo, N. Y. I claim, in combination, the hollow cylindrical bolt and the outside lever, when arranged in connection with a helical spring, substantially as and for We claim a boot heal consisting of the embedded skeleton frame, A, provided with the flanges on the rim, c, fixed screw, c, and rubber, g, constructed and arranged substantially as set forth. Fry, Fort Wayne, Ind.

We claim the lever, A, the concavo-convex or crescent-shaped step or link, B, in combination with the convex surface of the stud or lifter, C, the same being constructed in the manner and for the purpose described. 73,330.—IMPLEMENT FOR DRAWING NAILS.—Henry W. Holly.

I claim the laws, A A, constructed to open and close as described and with their upper ends or arms having converging sides, g, forming an opening, f, between them so that by lifting on the same through a lever inserted as specified to extract the nail the grip of the nippers is tightened on the latter, in the manner substantially as set forth. 73,331.—IMPLEMENT FOR DYERS AND BLEACHERS.—H. W

Holly, Norwich, Conn.
I claim the forked implement having the extremities of its times knobbed or enlarged, substantially as berein set forth for the purpose specified.
73,332.—DRY GAS METER.—T. C. Hopper, Philadelphia, Pa.

I claim, 1st, Producing both of the channels, a' a", on the same side of the partition, A, substantially as and for the purposes described.

2d. In the valve seat, B', the annular channel, b"', in combination with the closed center and narrow-faced dividing partitions, b" b", of the four openings which are surrounded by the said annular channel, b5, substantially as and for the purposes described.

3d. Casting the seat, B', of the valve and the projecting portion,b", thereof in one piece so that both of the channels, a' a", can thereby be produced exclusively on one side of the partition, A, substantially as described and for the purposes specified.

clusively on one side of the partition, A, substantially as described and for the purposes specified.

4th, in the rotary disk, B, of a gas meter the outlet, 3, in combination with the space above the faces, 22, and the annular channel, 4, arranged substantially in the manner described and shown for the purposes specified.

5th, Passing the spindle, C, loosely throughlithe rotary disk, B, and giving it a bearing in the seat, D', substantially as and for the purpose described.

6th, Giving rotary motion to the disk, B, upon the seat, B', by means of the cross bar, c', fixed in the spindle, C, in combination with the studs c'' c'', fixed in the said disk, B, when the spindle, C, passes loosely through B', substantially as and for the purpose described.

7th, Arranging the packing box, F, or the spindle, C, in the top of the valve cover, E, in the position shown as below the worm wheel for the purpose of admitting of the "repacking "as occasion may require without removing the king post, G, as described.

73.333.—Cupola Furnace.—John Howarth, Salem, Mass.

73,333.—CUPOLA FURNACE.—John Howarth, Salem, Mass. I claim in combination with a cupola, blast or other furnace (in which combined air and steam are used as described) the superheater chamber located directly over the furnace, substantially as described.

Also the superheater base, f, and its upright return bends, g, combined and arranged together and relatively to the furnace and air blast, substantially as shown and described.

73,334.—Locking Knob Latch.—W. L. Imlay, Philadelphia,

Pa.

I claim, 1st, Constructing the key bolt, B, with a projection, F, for the purpose of locking and unlocking the knob latch, A, by means of its described action in the slot of the knob latch, as set forth.

2d, The constructing and arranging of the knob latch, A, with the surface, a (for the action of the key), and the slot in its inmost end for the purpose of giving the knob latch a dead latch action and for the purpose of conjoined locking with the key bolt, B, thus making the latch, A, subserve any one or all of the three uses, as follows: of a simple knob latch, a dead or night latch and an additional security to the key bolt, B, as set forth.

22 225 Hyppoca phoy Burner W I Imley Philadel-73,335.—Hydrocarbon Burner.—W. L. Imlay, Philadel-

phis, Pa.

I claim, 1st, The construction of the vapor and gas chamber, B. with two walls the outer one of any suitable form and the inner one cone shaped or inclined inward, and operating substantially as set forth.

2d. The construction of the blast-equalizing chamber, E, larger than the flow pipe, D, and with the inclined apertures or escape, F, arranged just beneath or just within the lower part of the generator, as set forth.

3d. An apparatus for burning hydrocarbons constructed and made of the pipe, A, trom the reservoir, the chamber, B, flame blast aperture, G, tube, D, receiver, E, and escape apertures, F, operating substantially as set forth.

73,336.—Seeder and Cultivator Combined.—A. Ingalls,

Independence, Iowa.

I claim, 1st, The slide, G, as arranged in combination with the lever, H, and adjusting rod. I, for the purpose and in the manner as set forth.

2d, The graduating scale, F', in combination with the adjusting rod, I, for the purpose and in the manner as set forth.

3. The foot board, Q, and swing bar, O, as arranged in combination with the cultivators, N, for the purpose specified.

73,337.—CARD AND CRIBBAGE BOARD.—R. S. Jennings, Phil-I claim a card board constructed as described and so arranged as to be used for playing thereon the ordinary games of cards or the game of crib-

73,338.—Swage for Saw Teeth.—Nelson Johnson, Jasper, I claim, 1st. The provision of notches or teeth, a, on the swage stock to hold the notched or serrated saw tooth agianst displacement, substantially

2d. The adjustable swage pin or die, B, or its described equivalent, where-by the swage is made to accommodate or adapt itself to irregularities or va-riations in the saw teeth, substantially as described. 2d, A reversible supporting die or swage pin, B, having a convex or oval face in order to either spread the tooth sideways or draw the same endways,

substantially as described

4th. The die or stamping device, C, in combination with the spring helder. C1, and adjusting screw, C2, substantially as and for the purpose set forth. 78.339.—Machine for Pointing Pickets.—W. W. Johnson,

I claim the swinging arm, D, provided with the eccentric lever, F, and the holding clamp. E, when constructed and arranged to operate the picket against the knife, a, substantially as and for the purpose herein described. 73,340.—ANLE FOR WAGONS.—Daniel Jones, San Francisco, I claim the countersunk collar, C, either in combination with the strap. D, or, where used alone, constructed and arranged substantially as and for the

73,341.—Saw Frame.—Moses J. Jones, Fredonia, N. Y. I claim the saw frame, A B, constructed as described and used for the pur-

73,342.—Expanding Wheel Hub.—A. I. Judge, Baltimore,

1 ciaim, 1st, An adjustable base with an inclined face against which the ends of the several spokes of the wheel bear so arranged that the spokes may be simultaneously more or less extended through the hub by changing the position of the inclined base, substantially as and for the purpose set forth.

2d, Aiso to combination with a chambered hub the conical base, B, and adjusting screws, A, substantially as and for the purpose set forth.

73,343.—Shingle Machine.—Edmund Keith, Buffalo, N. Y. I claim, 1st. The sliding bar, P. and frame, Q. provided with inclined arms, q q, arranged and operating the pivoted tilring frame, N, substantially as

2d, Also the concentrically grooved wheel, H, in combination with the bar, P, grooves, ut, dog, c', with projections, d', and pin' v, all constructed and operating substantially as described.

2d, Also the gliding spring jaw or clamp, F, in combination with the lever, E, and eccentric, G, for alternately operating to release and hold the bolts, all constructed and arranged substantially as set forth.

73,344.—Clamp for Filing Saws.—Christian Kendig, Safe

Harbor, Pa. Antedated January 2, 1868.

I claim the bed pieces, A and A', when provided with the screws, e.e., the face block, B, provided with the screw, f, the jaws, C C', and the clamps, D D', arranged substantially as described and set forth. 73,345.—STREAM OR RIVER FENCE.—H. A. Kephart, Fletch-

I claim the sill pieces, A A, secured in position as shown, or in any equivalent way, and having the siats, B, attached in connection with the counterpoised slats, D, arranged substantially in the manner as and for the purpose

73,346.—Scaffold for Building.—James Lamb, Aurora,

and Francis Livings, East Enterprise, Ind.

We claim the horizontal bar, B, notched near its inner end, provided with diagonal braces, D D, and vertical bars, f f, boited together as described between which are passed the shore timbers, C, connecting into the notch in bar, B, for supporting one end of the platform, A, all constructed and used 73,347.—Coffee Mill.—W. J. Lane (assignor to himself and

J. G. Lane). Washington, N. Y. I claim the external shell or cone, D, of a coffee mill of the class described when provided with the pendent flange, a, surrounding the conical grinder, E, for the purpose of giving a downward direction to the ground coffee and preventing it from being scattered about in the mill, as herein shown and

73,348.—THRESHING MACHINE AND GRAIN SEPARATOR.—

Levi B. Lathrop, San José, Cal.

I claim, 1st, The device for imparting the peculiar motion as herein described to the screen, E, said device consisting of the inclined guides, C, arm, G, and crank shaft. H, or their respective equivalents.

2d, Providing a screen, E, with alternate depressions and elevations similar to waves, substantially as and for the purposes herein shown and described.

2d. The packing, e, when arranged at the sides of the frame of the screen, substantially as and for the purposes herein shown and described.

4th, Passing the grain by any suitable conveyor directly under the end of a section pine, as ast forth.

suction pipe, as set forth.

5th, The screen, E when arranged and operated as set forth in combination with the suction tube, I, the sa ne being arranged substantially as de-

6th, The tossing motion of the screen, E, when applied to the purpose of separating grain from straw or for separating it from chaff or for simply conveying light articles, substansially as described.

73,349.—FASTENING FOR WIRE FENCES.—W. E. Lockwood, Philadelphia, Pa.

arranged to turn in the brackets, B and B', or their equivalent, and is con

fined by a key, E, all substantially as and for the purpose herein set forth. 73,350.—APPARATUS FOR DRYING ENVELOPES.—William F Lockwood, Philadelphia, Pa.
I claim, 1st. Two sets of endless tapes or bands in combination with a train of pulleys, arranged substantially as described for the purpose specified.
2d, The combination of the parrow pulleys, C C', with the broader pulleys.

D, and the two sets of bands, for the purpose specified.

73,351.—Cartridge Extractor.—Horace Lord, Hartford.

1 claim discharging or throwing out the empty cartridge (after it has been extracted from the charge chamber) by means of a vibratory or biting lever or hammer arranged to strike the case, substantially as described.

78,329.—Wagon Jack.—Nicholas W. Hess and Jacob H. 73,352.—Berry Box.—Truman Mabbett, Jr., Vineland, N. J. I claim a box for berries and other small fruit, constructed of two upright end pieces, A A, and a body B, of semicircular form in its transverse section, and secured to the end pieces as shown, the body and end pieces being perforated or not, as desired, substantially as herein shown and described. 73,353.—Let-off for Looms.—J. A. Marden, Chelsea, Mass.

I claim, 1st. The combination of parts, D F and E, with parts, C and H, constructed, arranged, and operating substantially as described.

2d. The double friction brake, e e', operating upon the periphery of the wheel, C, and actuated by means of spring, H, and the whip roll and lever, D F, and yarn, G, substantially as described. 3d. The above in combination with a take-up mechanism, substantially as

78,354.—MILL SHAPE OR MOLD FOR MANUFACTURING TO-

BACCO.—Grandison F. Marks, Petersburg, Va.
I claim the iron plate, A, or other metal, of suitable thickness, and securing the same to the followers or sinkers, B B, and the plates, e e e, with strong rive s, C C C, for the construction of mill shapes or molds for manufacturing tobacco, substantially as herein set forth.

73,355.—Reflector.—Wm. M. Marshall, Philadelphia, Pa. I claim. 1st. The flexible base, B, of pasteboard, papier maché, wood, or sheet metal, in combination with the silvered strips of glass, A A, the metal frame, C C, and the curved wire mesh work, D D D, and the metal clasps, F F and H H H, substantially as described.

2d, The wire frame, C C, the curved wire mesh work, D D D, and the metal clasps, F F F, in combination with the g ass plates, A A A, and the base, B, when arranged together so as to form a reflector or section of a reflector, substantially as described and for the purpose set forth.

73,356.—GRAIN TESTER.—B. Martin, Prairie du Chien, Wis. I claim, 1st. The grain tester, with the scale, c c', graduated fit degrees.

I claim 1st. The grain tester, with the scale, c c', graduated 61 degrees downward, as described, and with a straight edge, r r', upon one side, for the purpose of leveling the grain in the bucket, P, as herein shown and de-

2d. The combination of the spring. L, rod, m, and bucket, P, with the index finger. H, and scale, c c', as herein described and for the purpose specified. 73,357.—Breech-loading Fire-arm.—James E. McBeth

(assignor to himself and Sheldon Sturgeon), New Orleans, La.
I claim the close hinged box, D, in which are completely incased the lock and cock, and which is held in position by means of the spring dog, I, as and for the purposes specified. 3,358.—Lock Catch and Stopper.—Edgar P. McCeney

Washington county, D. C.
I claim so combining and arranging a bent lever, b, a slide bolt, c, with a frame, a, in the manner substantially as and for the purposes set forth. 72,359.—ELASTIC PRINTING APPARATUS.—James McDermott,

Frederick, Md. I claim, 1st, The arrangement of the frame, A, movable bottom, B, set screws, H, vokes, E, and adjustable types, substantially as described.

2d, The concave roller, I, shaft, K, reciprocating frame, J, guide grooves, O k, lugs, J, frame, A, and inking apparatus, m m'n, when combined and arranged in the manner described.

73,360.—Windlass.—Wm. G. McIvor, Liverpool, England. I claim the application of strings to a windlass to operate in the manner substantially as and for the purpose specified. 73,361.—Ash Sifter.—Joseph A. Miller, New York city.

I claim the combination in a box or case, of the upper and lower chambers A B, grate, C D, the one portion, D, of which inclines upward, and sluice or grate, for cleansizg ashes or cinders by a water process, essentially as herein 73,362.—Apparatus for Singeing Cotton Cloth.—Joseph

A. Miller, New York city.

I claim, 1st, In combination with a rotating singeing body, or surface, the reflector, E, substantially as described.

2d, The combination of a damper, F, with a rotating singeing body or surface, essentially as specified,

73,363.—Steam Generator.—J. A. Miller, Providence, R. I I claim, 1st, The combination of the fire dome, F, with the fire chamber, C, and tubes, G J, arranged and operating essentially as herein set forth.

2d. The arrangement of the valves, H, within the smoke box, for controlling the central or fire dome flues, substantially as shown and described. 72,364.—Steam Generator.—J. A. Miller, Providence, R. 1

i claim, 1st, The combination of the tubes, C and E, with the shields, D, crown sheets, c, and lower sheets, d, substantially as specified.

2d. The combination of the shields, D, with the sediment tubes, E, and outer tubes, C, essentially as herein set forth. 73,365.—COMBINED DRILL, ROLLER, AND CULTIVATOR.—T.S.

Mills, Kendallsville, Ind.

I claim, 1st. Constructing the frame of the machine of two parts, A A, connected by joints, a, and each part provided with a roller, B, when said parts, thus constructed and arranged, are used in combination with a seed dropping apparatus for planting seed either in hills or drills.

2d, The operating of the toothed wheels, G, from one of the rollers, B, through the medium of the gearing, J M, pitman, I, connected with bar, K, and with crank pulley, H, on one of the shafts, F, of the wheels, G, all arranged substantially as and for the purpose setforth.

3d, The bar, O, attached centrally and longitudinally to the frame at its rear end, and provided at its front end with a caster wheel, P, in connection with the wheel K, and strap, I, or their equivalents, for raising and lowering the front part of the machine, as set forth.

4th, Operating the seed distributing wheels, U, through the medium of the toothed segment, W, at the lower end of the bent lever, X, and the pinion Y, on one of the shafts, F, substantially as and for the purpose specified.

73,366.—STAMP MILL.—Geo. R. Mitchell, Nevada, Colorado. I claim, 1st, The bearing, D, having the lower portion enlarged, forming a

I claim, 1st, The bearing, D, having the lower portion enlarged, forming a water chamber, a, substantially as described.

2d, In combination with the above and with the stem, B, of stamp, a, the water supply pipe, H, tube, F, stop cock, G, and flexible hose, E, substantially as described and for the purpose specified.

73,367.—MANUFACTURE OF ARGAND GAS BURNERS.—George

Mooney (assignor to himself, Job Arnold, and James Shaw, Jr.), Providence R. I.

I claim, ist, Forming an argand gas burner of one piece of metal, substantially as described.

2d. Forming the gas jet apertures through the top or rim of the burner without drilling, and substantially as described.

3d. The screw, f, forming an adjustable check, in combination with an argand burner, for the purpose of producing a still light, as herein shown and

3.368.—Horse Collar.—Thomas Moore, New York city. I claim forming a horse collar with one outside and one inside leather piece joined together at the sides, with two seams only, and bent around continuously at the bottom, so as to make a collar with a whole throat, having no cross seam, arranged substantially as herein described.

73,369.—Eye Medicine.—D. R. Morgan, San Francisco, Cal I claim the above described composition for treating the eyes, made of the ingredients enumerated, mixed or compounded in about the proportions 3.370.—Cork Extractor.—Jas. Morton, Philadelphia, Pa.

I claim a double lever cork extractor consisting of the bars, A C and D, all made and operating substantially as herein shown and described. 3,371.—Spinning Machine.—Robt. Moxley, Muscatine, O

I claim, 1st, The combination and arrangement of the shaft, a", belts, a a' shafts, F F', brake, T, treadles for tightening the belts, a a', belt, c, and carriage, C, all the said parts being constructed and operating together substantially in the manner and for the purposes specified. 2d The arrangement of the said parts with the belts, b and d, wheel, D, apron. J, faller, I, slide, L, set screw, I, inclines, g g, and gate, G, the whole constituting a combined hand roll and twisting machine, substantially as de-

Ed. The adjustable apparatus for indicating the twist, consisting of the slide O, belt, u, knot, o', lever, v, and bell, W, all arranged and operating substantially as and for the purpose set forth. 73,372.—Lamp.—George Neilson, Boston, Mass.

I claim in combination with the tops of lamps for using burning fluids, an annular cork packing, made, arranged, located, and held in position in the lamp, in the manner and for the purpose herein described and represented. 73,373.—APPLE SLICER.—H. Norton and J. S. B. Norton,

Farmington, Me:
We claim the combination as well as the arrangement of the corer, K, with
the knives, L L' and H H' H'', substantially as described and for the purpose

73,374.—Loom.—Benjamin Oldfield and Edwin Oldfield

Newark, N. J. Astedated Jan. 4, 1848.

We claim, 1st, The combination of a brake, c2 or d, with the tension spring c, reel, R. and shuttle, S, substantially as and for the purpose set forth.

2d, The spring catch or bridge piece, d, in combination with the shuttle, S, and reel, R, constructed and operating substantially as and for the purpose

3d, The loose peg, f, in combination with the shuttle carriers, C, guide bars, c, cams, g, and shuttle, S, constructed and operating substantially as and for 4th, The arrangement of slide bars, D, moving on the top of the batten, in a straight line, without rise and fall, having uprights attached thereto with holes in to receive a loose peg or stud capable of carrying a shuttle, each peg or stud receiving motion by a cam or its equivalent, substantially as and for the purpose set forth.

5th, The arrangement of cams, F, attached to or formed by the cog wheels E, in combination with stops, k, on the slide bars, D, substantially as and for the purpose described.

6th, The arrangement of a cam, n, and accounts.

6th, The arrangement of a cam, n, and eccentric, t, attached to and operated by the shart that carries the shuttle actuating devices, and in combination therewith, the spring stop, s, bar, E', and belt shipper, H, constructed and operating substantially as and for the purpose set forth.

7th, The arrangement of a brake, G, in combination with the stop motion and sbuttle motion, constructed and operating substantially as and for the purpose described.

pose described. Sth. Operating the harness by chains and chain wheels, N, and levers, L M, substantially as and for the purpose set forth.

9th, A harness motion composed of loose arms, L, each of which is pivoted

9th. A harness motion composed of loose arms. L. each of which is pivoted at one end to a lover, M. and at the opposite end to a circular or segmental chain wheel. N. substantially as and for the purpose described.

10th, The vibrators, J', in combination with the roes, I', carrying the hooks I', and with the intervening hinge, O. and pattern chain, Q. constructed and operating substantially as and for the purpose set forth.

11th, The arrangement of clastic springs or cushions under the pins or stude of the pattern chain, in combination with the T-headed shanks of said pins or stude, and with suitable ridges or cavities on the inner surfaces of the several leaves of the pattern chain, substantially as and for the purpose described.

73,375.—Combining Copper and Cast Steel.—James Park, Jr., Pittsburg, Pa. I claim combining copper and cast steel by heating the copper to a good red heat, and teeming or pouring thereon liquid molten cast steel, substantially as and for the purposes hereinbefore described.

73,376-KEEL AND BILGE BLOCK .- J. T. Parlour, Brooklyn,

N. Y., assignor to himself and William Beard.

I claim, 1st, The combination, with the blocks, B C D, and side pieces, E F, of the clains, G K, pulleys, M I L, ratchet wheel, Q, and pawl, R, all constructed, arranged, and operating substantially as described.

2d, The side strips to the supporting or cap piece of a bilge or keel block, substantially as and for the purpose specified.

73,377.—FINISH FOR PAINTED SURFACES,—H. T. Payne and

Wm. Ayres, San Francisco, Cal.
We claim a finisher for paint, consisting of crude galens, prepared and applied substantially as and for the purpose herein described. 73,378.—Case for Umbrella.—S. H. Pearce, Boston, Mass. I claim an umbrella-case composed of enamelled cloth, the parts of which are secured together by cement, substantially as described.
73,379.—MECHANICAL TOY.—H. G. Pearson, New York city.

I claim, 1st, A mechanical toy, the positive motions of whose parts are derived from a crank or cranks on the axis or revolving hoop.

2d, Also, the combination, with such a crank or cranks, of a system or systems of connecting links, substantially as shown and described.

3d, Also, in combination, a revolving hoop, carrying a suspended image or toy, which does not revolve, but whose members are given positive and determined movements, substantially as described.

4th, Also, the combination, with the rooling hoop of a mechanical toy, of a radial arm, projecting from the hoop toward its center, as and for the purpose set forth.

5th, Also, the combination, with such a hoop and radial arm, of a jointed 73,380.—Dropping Platform for Harvester.—G. M. Pe-

ters, Lancaster, Ohio. I claim, 1st, A slatted dropping platform adapted to turn upon a pivot lo-cated at its inner front corner, and to tilt or drop upon a hinge or fulcrum supports arranged in a line parallel with the finger bar, substantially as de-scribed.

2d. The semicircular plate, E, provided with the incline or offset, c'in com-

2d. The semicircular plate, E. provided with the incline or offset, c'.in combination with the quadrant plate, or its equivalent, attached to the platform, and operating substantially as described.

3d. The slatted platform, pivoted at its inner front corner, in combination with the plates, E and F, or their equivalents, substantially as described.

4th, The dropping platform, pivoted at its inner front corner, in combination with the forked lever, J, and cam wheel, K, substantially as described.

5th, The combination of the turning and dropping platform, with the cutoff, M, in the manner substantially as described, whereby the cut-off is operated by the same lever which throws into gear the mechanism operating the platform, as set forth. platform, as set forth.

73,381.—VALVE FOR STEAM ENGINE.—Wm. G. Pike, Philadelphia, Pa.

I claim, lst. The steam supply chest and supply-valves, B, and their stem.

E, in combination with the two exhaust valve boxes, N N', exhaust pipes, O O1, terminating in a single pipe, O2, exhaust valves, J J', and their stem, all arranged and operating in the manner and for the purpose substantially as

2d, Also, arranging the exhaust valves, J J', below the exhaust valve box covers, K K', so that said valves move upon and against the under side of said covers, substandally as set forth.

73,382.—Separator.—J. F. Pool, Monroe, Wis. I claim, 1 t, The thumb screws, P and W, when operating to adjust the screens, m and n, in the manner described.

2d, The screw, X, in connection with a roller, y, for regulating the hopper-

screen and hopper, as herein set forth.

3d. The bar, F, furnished with plates, g and e, in combination with shaft, H, plate, K, and hooks, s, the whole constructed substantially as set forth.

73,383.—BOXED HONE.—Joseph Potter and Oliff Abell, White-

We claim, as a new article of manufacture, the circular hone encased in a circular wooden box, having wooden cover, C, in such a manner as to protect the hone and keep its upper surface level, or from having depressions ormed therein by the action of the tool being ground, as herein shown and

73,384.—Animal Trap.—Samuel Reed, Whitestown, Pa. I claim the combination of the hinged vestibule, A, and trap, B, constructed and arranged substantially as and for the purpose herein specified. 73,385.—Car Coupling.—Horace Resley, Cumberland, Md.

I claim, 1st, The links or bars, A, with shouldered head and bevelled ends, and suspended by a flexible connection, so that they can rock or turn in the line of their length when they are to connect or disconnect the train, substantially as described.

2d, Also, in combination with the link or bar, A, constructed and operating as above described, the box, B, with shoulders, c.c., and rounded end, j, as and for the purpose herein described, and represented. and for the purpose herein described and represented.

73,386.—CRUTCH.—J. C. Rhodes, Stillwater, Minn.
I claim the handle, G. in combination with the rod, A. spur, B. and the devices for projecting and retracting said spur, substantially as set forth. 73,387.—ROOFING SCAFFOLD.—Peter Richmond, Aberdeen,

assignor to himself and Jacob Lamb, Aurora, Ind.
I claim the side pieces. A A, platform, B, plates, I I, and the frame, C C, or scantling, H, for forming a scaffold, the several parts being constructed and used substantially as and for the purpose set forth. 73,388.—Harvester Rake.—Samuel C. Ridgaway, Baltimore, Md.
I claim, 1st, Operating a harvester rake by means of a cam of suitable form.
In combination with a rotating arm and lever, or their equivalents, substan-

tially as described. 2d, The combination of the rotating arm, a, rod, D, and rake, R, with the cam, B, when constructed and arranged to operate substantially as and for he purpose set forth. 73,389.—Harness Pad.—H. R. Ridgley, Mansfield, Ohio.

I claim, as an improved article of manufacture, a harness-pad and iron, constructed as described, consisting of the solid flanged iron, m, having the crupper loop cast upon and with it, and the continuous pad, d, with its upper surface, m', formed of soleleather, covering and receiving the burrs, e, as herein described, for the purpose specified. 73,390.—Convertable Fork and Hook.—Lyman Riggs,

Lansing, Mich.
I claim, ist, The pin, F, constructed and operating substantially as and for the purposes set forth.

2d, in combination with the shank of a fork, having notches, A B and C.

the springs, D and E, constructed and operating substantially as specified. 73,391.—Chain Inclinometer.—Hermann Schussler, San

I claim a chain inclinometer having the level, I, and scale, A A, together with the handle, III, for ascertaining the correct horizontal distance when measuring, the whole constructed and operated substantially as and for the urpose herein described.

3,392,—Cultivator.—J. B. Sexton (assignor to himself and

John L. Andrew). Pella, lowa.

I claim, 1st, The adjustable iron bars, G, constructed substantially as herein shown and described, and adjustably attached to the end bars, at, of the frame, A, as and for the purposes set forth.

2d, The beams, H, constructed substantially as herein shown and described, that is to say, curved outward at their forward ends, and strengthened at their rear ends by the cross bars, J, as and for the purpose set forth.

3d, The curved adjustable bar or yoke, L, curved edgewise, and adjustably bolted to the cross bars, J, substantially as herein shown and described and for the purpose set forth. or the purpose set forth.

73,393.—SEED DRILL AND ROLLER.—S. Shirley, Guilford, III. I claim, 1st, The wheels, A1, with attachment, A2, in combination with frame, when arranged as described.

2. The frame, o, entter, E, hopper, O, drill point, Ol, rods, s s', when combined and arranged as and for the purpose explained.

Ed. The roller, P, with the V-shaped projection, having a triangular section cut out, as shown, as and for the purpose explained.

73,394.—Coal Box.—S. A. Simison (assignor to himself and

Boyd D. Simison) Earlyille, III.

I claim the hopper, B, and drawer, R, in combination with slide, C, and scuttle, G, the last two constructed and operating substantially by means as described, or other equivalent means, and the whole are anged substantially as described, forming a coal box of any desirable shape and size, for purposes herein set forth and specified. 73,395.—Movable Barrel Stand.—P. J. Skinner, Oswego,

I claim the combination of the barrel stand with the rollers, D, and unright, B, as and for the purpose specified. 73,396.—Change Gate for Railroad Cars.—J. B. Slawson,

New York city.

I claim, ist, A self-closing oscillating gate, B, when arranged in the door or front wall of a railroad car, omnibus, or other public vehicle, substantially as and for the purpose herein shown and described.

2d, A self-closin gate, B, when arranged as described, and when combined with a bell, I, so that whenever the gate is opened the bell will be struck, as

3d. The arrangement of the headed pin, E, and spring, h, in combination with the oscillating, self-closing gate, B, all made and operating substantially as and for the purpose herein shown and described.

73,397.—STORE TRUCK.—A. V. Smith, San Francisco, Cal. I claim, ist, The roller, B, brake bar, E, brakes, C C, holder, D D, metal arm H, and springs, c c, when applied to store trucks, substantially as described, for the purpose specified.

2d, The cross bar, I, handles, a a, straps, b b, ring, b', when arranged and operated substantially as described for the purposes specified.

3,398.—DEVICE FOR RAISING CASKS AND BARRELS.—Rob't

Smith, Brooklyn, N. Y.

I claim, 1st, A device for transporting barrels, casks, etc, which is made and operating substantially as herein shown and described.

2d. The wheels, B. when arranged in rows, the axies in one row not being in line with those in the other rows on the same side of the irame, A, substantially as and for the purpose herein shown and described.

3d. The frame, A, when provided with slotted upper bars, a, and blocks, g. in combination with the frame, C, and rollers, e and f, all made and operating substantially as and for the purpose herein shown and described.

4th, The device for changing the respective positions of the frames, A and C, consisting of the lever, E, connecting rod, G, cross bar, k, ears, I, and pin, all made, operating, and secured, substantially in the manner herein shown

m, all made, operadog, and secured, substantially in the manner herein shown and described. 5th, The rollers, D D, on the frame, C, in combination with the frame, A. and rollers, B, as set forth.

73,399.—Let-Off Mechanism for Loom.—T. S. Smith, Boston, and A. B. Ely, Newton, Mass., assignors to William N. Ely, Strat-ford, Conn. We claim, 1st, The arm, J, in combination with arm, I, and whip roll, F, hen J is made adjustable in I, and the parts are severally arranged, sub-

2d. The whip roli, F, and arm, I, having an adjustable arm, J, in combination with the single detent lever or pawl, K k, and escapement wheel, E, when severally constructed and arranged for operation, substantially as de-

The lever, G.g., with or without adjustable fulcrum, and having an adjustable weight, L. as set forth, in combination with rocking-shaft roll, F, all arranged substantially as described.

4th, The combination of lever, G.g. weight, L. arm, a, levers, F.I.J.K., and escapement wheel, E, all arranged and operating substantially as and for the purposes set forth.

5th, The rod, o, and brake, p.P. arranged in combination with and in relation to the yarn beam and whip roll, substantially as and for the purposes described.

6th. The red, o, and brake, p P, in combination with a let-off mechanism operated by the strain of the rare, substantially as described.

7th, The mechanism for throwing back the red, n, or red, o, to free the rare beam, substantially as described.

73,400.-WATER WHEEL .- William Snodgrass, Cold Spring,

I claim the float, D, with its valves, a' and c, the scroll, B, and the segment f. with the sliding piece, g., the spring, h. and screw, l, when arranged and combined substantially as described, and for the purposes set forth. 73,401.—MECHANICAL MOVEMENT.—E. Soper, N. Y. city

I claim a crank, when composed of the gear wheels, B and D, or their equivalents, and of the plates, C, and pin, a, all made substantially as described, and operating so that the velocity of the shart is increased without increasing the number of revolutions of the crank. 73,402,-COMBINED CATHETER AND SYRINGE.-Dr. N. B.

Sor. borger, Northampton, Mass.
I claim the slide or collar on the body to a syringe, in combination with a collar in the discharge tube, when the two are connected together and arranged for operation substantially as and for the purpose described.

Also, the loops applied to the cylinder of a syringe for receiving fastening straps, substantially as described.

Leage C. Spear, New Wilming.

73,403.—Horse Hay Fork.—Isaac C. Spear, New Wilming-

I claim, in connection with the curved lines of a hay elevator, a locking device, consisting of arms, b c, link, d, and detaching lever, f, or its mechanical equivalent, constructed and arranged substantially as and for the purposes hereinbefore set torth. 73,404.—Wash Board.—Edgar M. Stevens, Boston, Mass. Bl claim a corrugated wash board, when made of India-rubber mixed with fibrous material, and shaped and vulcanized to the mold, substantially as de-

73,405.—Skate.—W. X. Stevens, Waterford, N. Y.

I claim 1st, Forming the sole and blade of a skate from one continuous piece or sheet of metal by first slitting or cutting, and then bending the said netal sheet, substantially in the manuer and for the purposes herein shown 2d, A combined skate sole and blade, formed from a continuous sheet of

metal as described, and corrugated or indented at the angle formed by the sole, with the blade, so as to form braces for stiffening the said parts, substantially as shown and set forth. So, The combination with a skate of ordinary or suitable construction, of the hereio described spring clutch for grasping the boot sole, the same being pavoted to the forward part of the skate, so as to extend diagonally across

the sole of the same, under the arrangement and for operation as shown and 4th, The combination with a skate of ordinary or suitable construction, having a stationary jaw or equivalent bearing for the rear of the boot heel of the pivoted catch and adjustable set screw, for holding the said boot heel to the skate under the arrangement and for operation as herein shown and set

73,406.—Check-Rein Hook.—F. U. Stokes, Cincinnati, Ohio.

Antedated January 2, 1968.
I claim the drop piece, C. secured to the point of the check hook, as shown at c, for the purpose of closing the check hook and preventing the rein get-73,407.—Annealing Furnace.—W. R. Thomas, Catasauqua,

I claim the rings, F. placed between and supporting the car wheels, and atting snugly within the furnace, A. whereay the heat is prevented from reaching the chilled tread of the wheel, while the center is being annealed by intense heat, the whole supported upon the offset, s, in the furnace, as herein set forth for the purpose specified. 73,408.—MACHINE FOR SOFTENING LEATHER AND HIDES.—

Jonathan Tidd, Woburn, Mass.

I claim, 1st, A leather softening machine, constructed and arranged to operate substantially as described for the purpose specified.

2d, The periorated bed, B, or its equivalent, and the pins, c, or their equivalents, with the yielding cross head, G, and the supporting beam, K, for the purpose and substantially as described.

3d, The shalt, H, wheels or cranks, I, pitmen k and rods m, combined with the cross head, G, in the manner and for the purpose substantially as

4th. The nuts, d and e, and springs, g, combined with the rods, m, and the cross head, G, for the purpose and substantially as described.
73,409.—LAMP.—Howard Tilden, Boston, Mass.

I claim, 1st, The openings, 1 i, in the flange, C, arranged in relation to the cap, B, in the manner and for the purposes specified.

2a, The ring, D, when provided with the sustaining wires, e.e., and combined with the base, A, substantially as and to operate as set forth.

2d, The base, A, the ring, D, and the cap, B, when arranged with relation to each other substantially as described.

4th, The ring, J, arranged upon and used to lift the cap, B, by, as described and set forth.

72,410.—Sausage Stuffer.—John P. Troxell, Hancock, Md. I claim the sausage stuffing machine herein described, consisting of the hinged cylinders, C C', rack bars, H H', provided with disks, I I', situated as described, and operated by wheels, E F G G', so that while one cylinder is filling the other cylinder may be filled with meat, and prepared to fill its casing as soon as the first cylinder has done its work, and rice versa, substantially as described.

73,411.—Machine for Sizing Hat Bodies.—Henry Warner.

Newark, N. J.

I claim, 1st, The combination of the reciprocating rocking platen or board, C. platen or board, D. and connecting rods, zy, with the crank shaft, B. as and for the purpose described.

2d, The injectors, G and H. and the distributor, w. when used in combination with the boards, C and D. substantially as shown.

3d, The expressing rollers, F. and the weights, I. when combined with the described sizing machine, in the manner and for the purpose specified.

73,412,—CRANK PLANER — William H. Warren, Worcester,

1 claim, 1st, The combination, with a crank planer or like machine, of mechanism substantially as herein described, for regulating the throw of the crank without stopping or interrupting the continuous operation of the machine, as shown and set forth.

2d, The combination, with gear, F, and face plate, E, of the tubular shaft, g, central shaft, 3, screw shaft, 8, and gears, 4 h 6, and 7, substantially as and for the paragraph set forth.

for the purposes set forth.

3d, The combination with the shaft 2, and gear, 1, of the loose gear, 5, and pulley, 12, or its mechanical equivalent, operating substantially in the manner and for the purposes herein shown and described.

4th, The combination, with gears, 1 and 5, and pulley, 12, mounted on the shaft, 2, as described, of gears, 4 and h, and their respective shafts, arranged

for operation substantially as and for the purposes herein snown and speci 5th. The combination, with the friction pulley, 12, and beveled pin, 13, of the lever, H, and shoulder, 15, substantially as and for the purposes set forth.

73,413.—Mode of Straining Wood Saws.—Joseph R. Web-

ster, Boston, Mass.

I claim, in combination with a hand saw frame, the lever, i, and mechanism by which it is connected with the frame, and is operated to strain the saw blade, substantially as set forth. 73,414.—Tube Well.—Rollin C. Welch and Joseph B. Mil-

ler, Buffalo, N. Y.

We claim the imperforated external tube, D. connected with the perforated internal tube, A, by means of the inner collar, c, and the outer collar, b, so that the tube, D, comes in contact with an external shoulder of a conical plug, B, of the tube, A, during the operation of forming the enlarged water chamber, a, and rests upon a spring catch when the tube well is adjusted for operation, substantially in the manner and for the purpose described.

Clearge Wheeler, Chicago, Ill.

73,415.—Lantern.—George Wheeler, Chicago, Ill. I claim, lat. The arrangement of the conical tube or chimney. D. with the globe of a lantern, substantially as and for the purposes specified.

2d, Also, providing said chimney. D. with one or more disphragms. E. arianged and operating substantially as and for the purposes set fort.

3d, Also, In combination with the said chimney. D. and the openings, b b, in the lantern top, the arrangement of the perforated disk, c, in the manner and for the purposes described.

4th, Also, the arrangement of the draft openings, a b, in the lantern top, with the chimney, D. operating substantially as described.

73,416.—Desk and Seat.—Hiram W. White, Olney, Ill.

16 sim, 1st, The folding legs, C. C. C. in combination with the notches, 1234 and locking plates, F. for their equivalents, as a means for adjusting desks, tables, and chairs, vertically, substantially as described.

2d, The blocks, H. H. and rod, I. in combination with a desk, A. C. C., and chair, D. C., substantially as and for the purpose specified.

73A17.-CIDER MILL.-W. N. Whiteley, Jerome Fassler,

and O. S. Kelly, Springfield, Ohio.

We caim, 1st, Constructing the grinding box in two parts, substantially as set forth, and attaching the bearings of the crushing rollers to the upper part, as and for the purpose set forth.

2d, Mounting the journals of the grinding rollers, V. V. In boxes, which are attached to the lower side of the sidewise projecting flangs, by acrew bolts, and so that the said boxes may be slightly adjustable as to their distance from each other, as set forth and described.

2d, The construction of the press frame with the press beam, L., the stay rods, J.J., the front bosts, A. A., the girder, B., the tie rods, H. H., and the angle from I. I. as set forth.

4th, The two ribbed crushing vollers, S. S., and the two grinding rollers, V. directly beneath them, and running at different speeds, combined and arranged in a metallic grinding box constructed in two parts, and the bearings of one set of rollers connected to one of said parts, and the bearings of the other set connected to the other of said parts.

73,418.—ANIMAL TRAP.—James P. Wigal, Henderson, Ky. I claim, 1st, the combination of the coll spring, H, crank, G, lever catches I and J, spiral spring, L, or its equivalent, connecting rode, E and F, and arm

D, wi'b each other and with the wings, B and C, substantially as herein shown and deserted, and for the purpose set forth.

26, The communation of the pivoted platform, M, arm, N, connecting rod or wire, O, elbow lever, P, and bar, R, with each other and with the lever eatch, J, for the purpose of springing the trap, substantially as herein shown and described.

\$d. The combination of the arm, T, and connecting rod or wire, U, with the drop gate, S, and lever catch, I, for the purpose of resetting the trap, substantially as herein shown and described.

Stb. The combination of the curved arm, W. with the wing, B, and drop gete, V, substantially as herein shown and described, and for the purpose set

I claim, 1st, the worm fence, constructed as described, whereby pens or and can be formed by laterlocking from either side, as herein shown and

. The sections, provided with notches at one end in the under part of anch board, and, at the other end, in the top part of each board, the notches in the under side of one section engaging with the upper notebes of the other section, and beld in position by means of the cleats upon each side of the boards, near each end, all constructed and arranged as herein set forth, or the partners are subset. or the purpose specified.

78,421.—VENEER.—John B. Wilson, New York, N. Y. Telaim the vencer produced by a corrugated or zigzag cut, substantially in 2,841 .- MACHINE FOR MAKING DRAIN PIPE .- Bradford S.

te manner as described. 73,492.—PIPE COUPLING.—Lewis Wilson, Ovid, N. Y. I claim the double convex metal ring, b, interposed between the ends of the pipes, A A, and fitted into recesses, c c, formed therein, and retained in position by external pressure, applied through screw bolts, a a, or their quivalents, substantially in the manner and for the purpose described.

73,423.—Wood Turning Lathe.—E. K. Wisell, Warren, O. I claim the reciprocating and vibrating frame, II, pivoted to the adjustable rod, K, and carrying the adjustable live and dead centers, M M', arranged oncentrically with the axis of the revolving cutter-head, B, and operating ubstantially as and for the purpose described

78,424.—HARVESTER.—William F. Goodwin, East New York,

assignor to Samuel Johnston, Syracuse, N. Y.

Iclaim, 1st, The arrangement of pinions, H H', and the transmitting wheels on arms, F F', on and around the axle and within the drum, E, whereby the required number of revolutions is obtained, substantially as described.

2d, The spur and bevel pinions, H H' and I, mounted on the tubular sleeve or axle, and operated by means of the drum and transmitting wheels, substantially as described. stantially as described.

3d. The secondary arm, F', carrying the transmitting wheal gearing with the drum and secondary pinion, H', for the purpose set forth. 73,425.—Constructing Artesian Wells.—N. W. Green. Cortland, N. Y.

The herein described process of sinking wells, where no rock is to be pentrated, viz., by driving or forcing down a rod to and into the water under round, and withdrawing it, and inserting a tube in its place to draw the waer through, substantially as herein described. 73,426.—Combined Trough and Double Rack for Febd-ING SHEEP, CATTLE AND HORSES .- James Douglass McBride, Mansfield,

I claim, 1st, The box trough, A, constructed substantially as described, and provided with the rack, T, and the supplementary troughs formed by the hinged boards, B B, as and for the purpose herein set forth.

2d, The rack, composed of the bars, D D and D', and bars, E, forming a double rack, and hinged cover for the box, A, when used in combination with the said box, substantially as set forth.

3d. The graduating and bars, P.P. used in combination with the lart D', for

id. The graduating end bars, P.P. used in combination with the bar, D', for enlarging or contracting the upper and lower racks, as and for the purpose

REISSUES.

2,830.—Car Starting Apparatus.—Joseph Steger, New

York city. Dated July 9, 1867.
I claim, 1st, The multiplying gear, consisting of the traction bar, T, lever or equivalent, L, pivoted pawl, R, ratchet wheel, W, spiral spring, S, and spring, PS, constructed and operating substantially as and for the purpose

2d. The gearing device, consisting of the spring, P S, provided with a foot outton and the pawl, R, suspended from said spring, substantially as and for the purpose set forth. 2,831.—Nursing Bottle.—Milo S. Burr, Boston, Mass., as-

signee by mesne assignment of Francis J. La Forme. I claim my said improved nursing bottle, having its body, A, composed of lass or other suitable material, and provided with an elastic nipple, or mouth piece, f, and a flexible or pendulous tube, C, applied thereto, substantially in manner and so as to operate as and for the purpose set forth.

Also, in a nursing bottle, otherwise properly organized, the use or application of a flexible or pendulous tube, substantially as and for the purpose set

Also, the application of a gravitating tip or tube, e, to the lower end of the exible tube, o, substantially as an i for the purpose set forth. 2,832.— HEATING APPARATUS.— Thomas S. Clogston, Bos- signed.

ton, Mass. Dated Dec. 13, 1861. I claim the application and use, for heating purposes, of one or more tubes having a corrugated or annular ribbed surface, in combination with a boller or other suitable steam generator, and pipes for conducting the steam or hot water from said generator to the corrugated tubes, essentially as herein shown and described.

2,858.—CHAIR.—Levi Heywood (assignor to Heywood, Brothers, Co.), Gardner, Mass.

2,859.—FLOOR OIL CLOTH PATTERN.—John T. Webster, New York city, assignor to Edward Harvey, Brooklyn, N. Y. 2,833.—Pegging Machine.—Wm. N. Ely, Stratford, Conn.,

assignee of Edgar M. Stevens. Dated May 28, 1867.

I claim, 1st. The combination of a vibrating moving awl with a sliding or vertically moving, or a swinging head, substantially as described.

2d, The combination of a feeding awl, with a sliding and swinging head, or with a sliding head, or with a swinging head, substantially as described.

3d, Raising and driving the awl bar and peg driving bar, or either of them, positively and directly, by means substantially as described, in combination with a laterally moving or feeding awl.

4th, So constructing the parts that the awl bar, moving up and down perpendicularly to its carriage, shall also move laterally, substantially as and for the purposes described.

or the purposes described.

5tb, In combination with the foregoing, the laterally and vertically moving eg driving bar, substantially as and for the purposes described.

6th, Constructing and arranging the knife in relation to the driver and peg libe, substantially as described. 7th, Cutting the peg from the strip, substantially as described. 2,834.—SCYTHE FASTENING.—Pinckney Frost, Springfield,

Vt. Dated Jan. 11, 1853. Reissue 524, dated Feb. 9, 1858; extended seven I claim the loop bolt, provided with the groove, b, and the hook or loop, e, in combination with the set-ring, also provided with a groove, b', all constructed and arranged substantially as and for the purpose set forth.

2,835.—STEAM BOILER FURNACE.—John T. Hancock, Bos-

ton, Mass. Dated March 1, 1854.

I claim the method of supplying air and steam to ignited fuel in furnaces, y commingling and then introducing them into an enclosed space under the rate bar, by means substantially as above described.

2.836.—HAND STAMP.—B. B. Hill, Chicopee, Mass. Patented November 6, 1866.

I claim, 1st, The employment of an indicator index or calendar, R R', to represent the period of time, in combination with stamp-canceling wheels.

I.J. arranged and operating substantially as described.

2d, Also, the wheel case, G, stud or axis pin, a, with the ribbon cylinder when made in one piece of metal, substantially as and for the purpose de-

Sd. Also, the calendar wheels, R R', arranged upon the same axle with the wheels, I J, in combination with the hand stamp, arranged and operating substantially as described.

4th, Also, the bracket, H, made on or secured to the case, G, having a step. c, or its equivalent, to enter the lower end of the spindle, and orifice for the screw, e, for attaching and detaching said case to the spindle, E, substantially as and for the nursess described.

y as and for the purpose described.

5th, Also, in a hand stamp, the employment of the flanch, K, on the chase, in combination with the case, G, and bed, C, for the purpose of easily and nickly attaching and detaching said chase on or off of said case. 2,837.—Straw Cutter.—Franklin Benjamin Hunt, Richmond, Ind. Patented January 5, 1864. Reissue 2,368, dated October 2

I claim, 1st, The bar, x, cast in one piece, with the bearings, b b, of cutter shaft, c, and extending across from one to the other, substantially as shown.

2d, Also, connecting the feed rollers, G and H, by means of the pinions, a', b', d', and e', the pinions, b' and d', being placed on stude on the swinging plate, c', attached to the shaft, n, the pinions, d' and e', being kept in gear by the link, f, or its equivalent.

Sd. Also, the swinging plate, c', connected to the shaft, n, and carrying the pinions, b' and d', substantially as and for the purpose shown and set forth.

4th, Also, mounting the upper feed roller, II, in a frame, with sling extending below the lower feed roller, and acted upon by a spring, or its equivalent, substantially as shown and for the purpose set forth.

5th, Also, the hooked slings, q q, in combination with the yielding feed roller, H, and spring, I, or its equivalent, whereby the said feed roller. H, is limited in its upward movements, as set torth.

6th, Also, the lunks or bearings, n' n', attached to the slings, q, and sur-

7th, Also, the guide board or plate, u, connected to and moving with the frame, t, of the upper feed roller, H, and extending downward at the back of the said roller to near a level with its axis, substantially as and for the

purpose set forth.

Sto. I claim the slots, v.v. in the plates, w. when made eccentric with shaft, C. in combination with pinious, a. b. d. and e. said pinions connecting feed rollers. H and G. so that the adjustable roller can move up and down concentric with shaft, C. and the pinious remain in great, substantially as set forth.

9th, Also, in combination with the bar, x. and adjustable bar, E. a revolving keife. D. with its axis placed above the plane of the adjustable entter bar, E. to act with a slanting and shearing cut, substantially as set forth.

2,838.—Straw Cutter.—Franklin B. Hunt, Richmond, ind., assignes by mesne assignments of himself. Patented December 27,

3d, The plate, Y. for the purpose of covering the joint between the adjust-able bar, T, against which the knife cuts, and the bed piece, R, in manner substantially as set forth. 4th, The link bearings, M. attached to the shatt, D. and carrying the feed roll, Q in combination with the eprings, W, in such manner that, as the roll rises, it shortens the operative length of the springs, and thereby gives the

greatest pressure to the roll when most needed, in manner substantially as

oth. Attaching the fly wheel of a feed cutter to its shaft in such manner as o constitute a yielding device between said wheel and the cutting knife, for 6th, Attaching the knife cylinder of a feed cutter to its shaft in manner shows, or in an equivalent way, to constitue a yielding device between the knife and other parts of the machine, for the purpose herein shown and set

78,419 .- MANUFACTURE OF PENS. -- Edwin Wiley, Brooklyn, 2,839 .- FIRE ANNIHILATOR .- Chas. T. Jerome, Minneapolis,

N. Y.

I claim, in the manufacture, of pens, composed of both gold and silver and known as the Union Pen, giving the seam between the two metals an extra chickness by means of solder, or otherwise, substantially as and for the purpose described.

N. Y.

I claim, is the manufacture, of pens, composed of both gold and silver and take fire at a low temperature, to an apparatus for extinguishing fires by an injection upon the same of a gaseous or a liquid non-supporer of combustion, substantially as described.

2d. Preparing the ends of the quick matches with a composition composed of the within described ingredients mixed together in about the proportions and forth. Minn. Patented July 9, 1867.

840.—CLOTHES WRINGER,—C. H. Knox, Mount Pleasant. Town. Patented July 2, 1807. I claim, lst. The double cog wheel, P, and double plaion, S, substantially as 2d, The combination of cog wheel, P, and plalon, S, with rollers, D D, sub-

stantially as and for the purpose set forth.

Sd. The arrangement and combination of lever, M, hinged to box, A, roller L, rods, K, levers, I, and plate, C, arranged to operate upper roller, D, as set

Pierce, New Bedford, Mass., and Mason R. Pierce, Woodstock, N.Y. Patented April 19, 1859. Reissue 1,897. Dated Feb. 28, 1865.

We "laim, 1st, A mold consisting of a case capable of being properly secured around the material white the pipe is being mo ded, and of being freed from the pipe when the molding is completed, in combination with a core, and also with a core socket, having a provision for freeing the socket or pipe, or both, from the core, the whole operating substantially as set forth.

26. A mold in which the core socket is made separate and distinct from the other parts, and so formed, and so combined with such other parts, that it is capable of being connected with them when the mold is ready for use, and of being continuously kept connected with them during the entire process of molding and unishing the pipe, substantially as and for the purposes described.

3d. The arrangement of the mixing apparatus and of the core relieving deives above the platform, which conveys the molds in the manner and for the purpose substantially as specified. 4th. The combination of the core socke; with the revolving disk, which re-ceives the core and the mold, when the disk contains a provision for enabling

the socket or pipe, or both, to be freed from the core, the whole operating ubstantially as described. 2,842.—Hoop Skirt.—Wm. T. Ryerson, Philadelphia, Pa.

Patented Aug. 27, 1837.

I claim a skeleton skirt provided with buckles, or their equivalents, near the walst band, for adjusting the vertical tapes or connections at the sides of the skirt, to accommodate the size and shape of the hips, or vary the length of the skirt, substantially as set forth.

2,843.—Weaving.—William Smith, New York city. Dated April 5, 1833. Extended seven years. Reissne 2,656. Dated June 18, 1867. I claim the process herein specified of weaving consisting in the use of stationary warps in combination with moving warps and filling that inclose such stationary warps, substantially as set forth.

2,844.—Weaving.—William Smith, New York city. Dated April 5, 1853. Extended seven years. Reissue 2,656. Dated June 18, 1867. I claim the heddle, or its equivalent, for supporting the stationary central warps in combination with mechanism, substantially as set forth for performng the weaving.

2,845.—CENTRIFUGAL MACHINE FOR DRAINING SUGAR AND OTHER SUBSTANCES .- David M. Weston, Boston, Mass. Dated April 9,

I claim, 1st, In the construction of centrifugal machines for separating liquids from other substances suspending such machines at the top by flexible connections, operating substantially as described.

2d. The combination of the spindle, D, and its accessories with the socket. B, and its indis-rubber bushing. C, or other equivalent spring connection to form a flexible and clastic bearing for the snaft, E, by which the cylinder may be suspended, substantially as described.

3d. The employment in a centrifugal machine of a bollow shaft and a spindle or axle on which it runs to support the cylinder or basker, substanially as described.

4th, So forming and arranging the driving pulley, F, upon the shaft, E, that it shall surround the spring-bearing, substantially in the manner and for the purpose described. 5th, The construction of the openings, I, in the bottom of the cylinder in such machines and the valve, J, for the purpose of c'osing the same, sub-

stantially as described. 6th, The combination of the cylinder, G, the hollow shaft, E, the driving pulley, F, the spindle, D, its elastic bushing, C, and socket, B, to form the operative part of a centrifugal machine, substantially as described.

2,846.—Printers' Chase.—Richard Yeomans, Cincinnati, Ohio. Dated October 24, 1865. I claim the transverse notches or grooves in combination with the projecting transverse obtuse edges specifically as set forth, for the purposes de-

DESIGNS. 2,858.—Chair.—Levi Heywood (assignor to Heywood, Broth-

York city, assignor to Edward Harvey, Brooklyn, N. Y.

PENDING APPLICATIONS FOR REISSUES.

Application has been made to the Commissioner of Patents for the Reissue of the following Patents, with new claims as subjoined. Parties who desire to oppose the grant of any of these reissues should immediately address Munn & Co., 37 Park Row, N. Y.

47,753. — Plow Casting. — Francis F. Smith, Collinsville, Conn. Dated May 16th, 1865. Application for reissue received and filed I claim, as a new article of manufacture, plow plates made of scemic steel,

faced with cast steel. 9,540.—Operating the Treadles of Looms.—Robert M. Andrews, Stafford, Conn. Dated January 18th, 1853. Extended January 17th, 1867. Application for reissue received and filed January 8th, 1868. I claim operating each treadle by means of a mover having two outwardly acting cam surfaces of unequal lengths combined in one piece, and producing the movements and retentions substantially as herein set forth.

I also claim such a relative form and arrangement of the treadles and the movers and cams, that the cams can be reversed upon the shaft, and thereby cause a reversal of the movements and retentions of the said treadles, substantially as herein set forth.

I also claim, in a cam loom, having upright transfles, or harrows layare and recombined in the said treadles.

I also claim, in a cam loom, having upright treadles or harness levers, actuated by a single set of cam wheels arranging the fulcrum shaft of the harness levers directly over or within the vertical plane of the cam wheels, substantially as described.

substantially as described.

54,589.—Gearing.—Metropolitan Washing Machine Company, Middlefield, Conn., assignees of S. Wand, J. F. Palmer, Auburn, N. Y. Dated May Sth, 1896. Application for reissue received and filed January 3d, 1868.

I claim, 1st, Forming upon either or both faces of a disk or circular plate, cogs or teeth, so as to project from the faces of said disk in contradistinction to forming said teeth upon a hub so as to project radially therefrom, substantially as and for the purposes herein shown and described.

2d. The combination of toothed or cog wheels of ordinary or suitable construction, when used in pairs upon the same shaft, with a plate or plates arranged upon the interior opposite or exterior opposite faces of either pair in the manner described, whereby the wheels on the one shaft shall be held in place by the plate or plates of the wheels on the other shaft, and thus prevent the lateral play of the one shaft with respect to the other as set forth.

3d, in a machine having shafts arranged to operate, at varying distances from each other as described, the combination with a circular plate or plates on one shaft of a hub upon the other shaft, under such an arrangement that when the gear wheels of the shafts have engaged to a certain extent or depth the said plate or plates and hub shall come in contact and prevent the turther and undue penetration of the teeth of said gears, substantially as and for the purposes specified.

66,044.—Automatic Apparatus for Lighting and Extin-

66,044.—Automatic Apparatus for Lighting and Extin-GUISHING GAS.—E. P. Russell and P. Tromain (assignees of E. P. Russell), Manlius, N. Y. Dated June 25th, 1867. Application for relasue received and filed January 4th, 1868.

and filed January 4th, 1868.

1 claim, 1st, The screws, F. F', the bolts, J. J', the disk, H, and the arms, H', each separately and in combination with each other, made and operated substantially as and for the purposes set forth.

2d, The combination and arrangement substantially as described, of the main spring, K, gas cock, N, and arms, H', for the purposes set forth.

3d, The step shaft, E, and thumb screw, I, each separately and in combination with the hollow shaft, F, and the hands, D.D', arranged and operated substantially as and for the purposes described.

4th, I claim the springs, Ji', separately and also in combination with the bolts, J. J., when made and operated as above described.

70,272.—MODIS OF LIGHTING STREET GAS BURNERS—E. P.

6th, Also, the hubs or bearings, u'u', attached to the slings, q q, and surrounding the shatt, p, of the feed roller, H, said hubs moving in slots, b b, in plates, w, and relieving the shaft from friction against the plates, as set Russell, and Porter Tremain (assigness of E. P. Russell), Mantius, N. Y. Dated ett. 29th, 1867. Application for reissue received and filed January

I claim a small supplemental burner, A, to be kept burning constantly, and he pipe leading thereto when operating in connection with a main burner, abstantially as and for the purposes set forth.

I also claim the same parts, in combination with a main pipe and burner, to be used in connection with any kind of automatic apparatus for lighting and extinguishing gas, substantially as above described.

13,197.—MACHINE FOR MITERING PRINTERS' RULES.—R.

Hoe & Co. (assignees of William McDonald), New York city. Dated July 3d, 1855. Application for reissue received and filed January 6th, 1863. I claim the combination with a movable cutter of a sector, guide, plate, a rule holding bed and adjusting mechanism, constructed and operating substantially as described and for the purposes specified.

I claim, 1st, Combining in one piece the bed piece, R, upon which the adjustable bar, T, rests, and the side pieces, V V, substantially as shown and described.

2d. The sejustable bar, T, against which the knife cuts, when secured, by vertical bolts, U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. U, to an immovable bearing within the limits of the width of vertical bolts. MUNN & CO., Solicitors of Patents, 37 Park Row, N. Y.

Advertisements.

The value of the Scientific American as in advertising medium cannot be over-estimated. Its circulation is ten times greater than that of any similar journal now published. It goes into all the States and Territories, and is read in all the principal libraries and reading rooms of the world. We invite the attention of those who wish to make their business known to the annexed rates, A business man wants something more than to see his advertisement in a printed newspaper. He wants circulation. If it is worth 25 cents per line to advertise in a paper of three thousand circulation, it is worth \$2.50 per line to advertise in one of thirty thousand.

RATES OF ADVERTISING.

Back Lage \$1.00 a line. Engravings may head advertisements at the

same rate per line, by measurement, as the letter press.

540 MILES

Union Pacific Railroad

Running West from Omaha

Across the Continent. ARE NOW COMPLETED,

The Track being Laid and Trains Running Within

TEN MILES OF THE SUMMIT OF THE ROCKY MOUNTAINS.

The remaining ten miles will be finished as soon as the weather permits the road-bed to be sufficiently packed to receive the rails. The work continues to be pushed forward in the rock cuttings on the western slope with unabated energy, and a much larger force will be employed during the current year than over before. The prospect that the whole

GRAND LINE TO THE PACIFIC WILL BE COMPLETED IN 1870,

was never better. The means provided for the construction of this Great National Work are ample. The United States grants its Six Per Cent Ronds at the rate of from \$16,000 to \$48,000 per mile, for which it takes a second lien as security, and receives payment to a large if not to the full extent of its claim in services. These Bonds are issued as each twenty mile section is finished, and after it has been examined by United States Commissioners and pronounced to be in all respects a first class road, thoroughly supplied with ANUFACTURE Steam Hammers of depots, repair shops, stations, and all the necessary rolling stock and other equipments.

The United States also makes a donation of 12,800 acres of land to the mile, which will be a source of large revenue to the Company. Much of this land in the Platte Valley is among the most fertile in the world, and other large portions are covered with heavy pine forests and abound

in coal of the best quality. The Company is also authorized to issue its own First Mortgage Bonds to an amount equal to the issue of the Government and no more. Hon, E. D. Morgan and Hon. Oakes Ames are Trustees for the Bondholders, and deliver the Bonds to the Company only as the work progresses, so that they always represent an actual and productive

The authorized capital of the Company is One Hundred Million Dollars, of which over five millions have been paid in upon the work already done.

EARNINGS OF THE COMPANY.

At present, the profits of the Company are derived only from its socal traille, but this is already much more than snificient to pay the interest on all the Bonds the Company can issue, if not another mile were built. It is not doubted that when the road is completed the through traffic of the only line connecting the Atlantic and Pacific States will be large beyond precedent, and, as there will be no competition, it can always be done at profitable rates.

It will be noticed that the Union Pacific Railroad is, in fact, a Government Work, built under the supervision of Government officers, and, to a large extent, with Government money, and that its bonds are issued under Government direction. It is believed that no similar security is so carefully guarded, and certainly no other is based upon a larger or more valuable property. As the Company's

FIRST MORTGAGE BONDS

are offered for the present at 90 CENTS ON THE DOLLAR, they are the cheapest security in the market, being more than 15 per cent lower than U. S. Stocks.

SIX PER CENT IN GOLD,

or over NINE PER CENT upon the investment, and have thirty years to run before maturity. Subscriptions will be received in New York at the Company's Office, No. 20 Nassau street, and by

CONTINENTAL NATIONAL BANK, No. 7 Nassau st , CLARK, DODGE & CO., Bankers, No. 51 Wall st.

JOHN J. CISCO & SON, Bankers, No. 33 Wall st., and by the Company's advertised Agents throughout the United States. Remittances should be made in drafts or other funds par in New York, and the bonus will be sent free of charge by return express. Parties subscribing through local agents will look to them for their safe de-

A New Pumphlet and Map, showing the Progress of the Work, Resources for Construction, and Value of Bonds, may be obtained at the Company's Offices, or of its advertised Agents, or will be sent tree on application.

Wan abreifire MUNN & CO. 37 Park Row, New York,

The First Inquiry that presents used to one who has made any covery is: "Can I of tain a Patent?" A positive answer cau only is had by presenting complete application

for a l'atent to the Commissioner of Patenta. An application consiste of a Model, Drawlings, of a Model, Drawlings, of a Model, Drawlings, of a Model, Drawlings, of the inventor to do all this business himself are generally without success. After a season of great perplexity and delay, he is usually glad to seek the aid of persons experienced in patent business, and have all the work done over again. The best plan is to solicit proper advice at the beginning.

advice at the beginning.

If the parties consulted are honorable men, the inventor may safely counde his ideas to them: they will advise whether the improvement is probably patentable, and will give him all the directions needful to protect his

Messrs, MUNN & CO., in connection with the publica-tion of the Scientific American, have been actively en-gaged in the business of obtaining patents for over twenty years—nearly a guarter of a contury. Over Fifty thou-sands inventors have had benefit from our counsels. More than one third of all patents granted are obtained by this

These who have made inventions and desire to consult with us, are cordially invited to do so. We shall be happy to see them in person, at our office, or to advise them by letter. In all cases they may expect from us an honest opinion. For such consultations, opinion, and advice, the make no charge. A pen-and-lak sketch, and a description of the invention should be sent, together with stamps for ceture postage. Write plainly, do not use pencil nor pale tak; he brief.

All business committed to our care, and all consulta-tions, are kept by us secret and strictly confidential. Ad-dress MUNN & CO., 37 Park Row, New York.

Preliminary Examination, sake out a written description of the invention in your own words, and a rough pencil or pen-and-ink sketch. Send these with the fee of 35 by mail, addressed to MUNN & CO., 37 Park Row, and in one time you will receive an acknowledgment thereof, tollowed by a written report in regard to the patentability of your improvement. The Preliminary Examination consists of a special search, which we make with great care, among the models and patents at Washington to ascertain whether the improvement presented is patentable.

In Order to Apply for a Patent, the law requires

In Order to Apply for a Patent, the law requires that a model shall be furnished, not over a foot in any dimensions,—smaller, if possible. Send the model by express, pre-paid, addressed to Munn & Co., 37 Park Row, N. Y. logether with a description of its operation and merits. On receipt thereof we will examine the invention carefully and savise the party as to its patentability, free of

The model should be neatly made of any sultable mate-The model should be nearly made of any suitable materials, strongly fastened, without glue, and neatly painted. The name of the inventor should be engraved or painted upon it. When the invention consists of an improvement upon some other machine, a full working model of the whole machine will not be necessary. But the model must be sufficiently perfect to show, with clearness, the nature and operation of the improvement.

New medicanes or medical compounds, and useful mixtures of all kinds, are patentable.

New medicines of medical compounds, and useful interest of all kinds, are patentable.

When the invention consists of a medicine or compound, or a new article of manufacture, or a new composition, amples of the article must be turnished, neatly put up. Also, send us a full statement of the ingredients, proportions mode of preparation, uses, and merits.

Reissues.—A reissue is granted to the original patentee, his beirs, or the assignees of the entire interest, when by reason of an insufficient or detective specification the original patent is invalid, provided the error has arisen from inadvertence, accident, or mistake without any translulent or deceptive intention.

A patentee may, at his option, have in his reissue a separate patent for each distinct part of the invention comprehended in his original application, by paying the required fee in each case, and complying with the other requirements of the law, as in original applications.

Each division of a reissue constitutes the subject of a separate specification descriptive of the part or parts of the invention claimed in such division; and the drawing may represent only such part or parts. Address MUNN & CO., 37 Park Row, for full particulars.

Interferences.—When each of two or more persons

Interferences. When each of two or more persons claims to be the first inventor of the same thing, an "Interference" is declared between them, and a trial is had before the Commissioner. Nor does the fact that one of the parties has already obtained a patent prevent such an tuterference; for, although the Commissioner has no power to cancer a patent already issued, he may, if he finds that another person was the prior inventor, give him also a patent, and thus place them on an equal tooting before the courts and the public

Caveats.--A Caveat gives a limited but immediate protection, and is particularly useful where the invention is not fully completed, or the model is not ready, or further time is wanted for experiment or study. After a Caveat has been filed, the Patent Office will not issue a patent for the same invention to any other person, without giving notice to the Caventor, who is then allowed three months time to file in an application for a patent. A Caveat, to be of any value, should contain a clear and concise description of the invention, so far as it has been completed, illustrated by drawings when the object admits, in order to file a Caveat the inventor needs only to send us a letter containing a sketch of the invention, with a description in his own words. Address MUNN & CO., 37 Park Bow, N. Y.

Additions can be made to Caveats at any time. A Caveat runs one year, and can be renewed on payment of \$10 a year for as long a period as desired.

Quick Applications.—When, from any reason, par s are desirous of applying for Patents or Caveats, in GF at HASTE, without a moment's less of time, they have only to write or telegraph us specially to that effect, and we will make special exertions for them. We can prepare and mail the necessary papers at less than an hour's notice, if required.

Foreign Patents.--American Inventors should bear in mind that, as a general rule, any invention that is valuable to the patentee in this country is worth equally as as much in Engiand and some other foreign countries. Five Patents-American, English, French, Belgian, and Prussian-will secure an inventor exclusive monopoly to his discovery among one hundred and the world. The incilities of business and steam communication are such that patents can be obtaine; abroad by our citizens almost as easily as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Scientific American Patent Agency. A Circular containing further information and a Synopsis of the Patent Laws of various countries will be furnished on application to Messrs. Munn & Co.

For Instructions concerning Foreign Patents, Reissues, Interferences, Hints on Selling Patents, Rules and Proceedings at the Patent Office, the Patent Laws, etc., see our Instruction Book. Sent free by mail on application. Those who receive more than one copy thereof will oblige by presenting them to their friends.

Address all communications to

Scientific American.

THE

BEST PAPER IN THE WORLD.

Published for Nearly

A QUARTER OF A CENTURY.

This Splendld Newspaper, greatly enlarged and improved, is one of the most reliable, useful, and interesting journals ever published. Every number is beautifully printed and elegantly illustrated with several Original Engravings, representing New Inventions, Novelties in Mechanics, Agriculture, Chemis try, Photography, Manufactures, Engineering, Science and Art.

Farmers, Mechanics, Inventors, Engineers, Chemists, Manufacturers, people in every profession of life, will and the SCIENTIFIC AMERICAN to be of great value in their respective callings. Its counsels and suggestions will save them Hundreds of Dollars annually, besides affording them a continual source of knowledge, the value of which is beyond pecuniary estimate. All patents granted, with the claims, published weekly. Every Public or Private library should have the work

bound and preserved for reference.

The yearly numbers of the SCIENTIFIC AMERI-CAN make a splendid volume of nearly one thousand quarto pages, equivalent to nearly four thousand ordinary book pages. A New Volume commences January 1, 1888. Published Weekly. Terms : One Year, \$3; Half-Year, \$1 50; Clubs of Ten Copies for One Year, \$25; Specimen Copies sent gratis. Address

> MUNN & CO., 37 Park Row, New York.

The Publishers of the Scientific American. in connection with the publication of the paper, have acted as Solicitors of Patents for twenty-two years. Thirty Thousand Applications for Palents have been made through their Agency. More than One Hundred Thousand Inventors bave sought the counsel of the Proprietors of the SCIENTIFIC AMERICAN concerning their inventions. Consultations and advice to inventors, by mail, free.
